I'm thinking of getting an amp. I'm running a grant xl with a wilson 5000. I hear allot of talk about 100 watts being all you need to talk around the world on ssb. I didn't want to make a big production out of this. I wanted to use my stock alt - etc. Any tips, ideas, opinions, etc would be mega appreciated :)

Not to take sides on this issue but: Did this article come from the ARRL? If it did, read it with "tongue in cheek".

Some years ago, here in RI, a woman's TV was being interfered with by a CBer. This person called a neighborhood friend, who was a Ham, for advice. The two actively solicited the FCC for some sort of enforcement action which never came.

All of a sudden this same gentleman (The Ham) was also receiving interference from this same CBer (It was a miracle because this CBer had been on the air for 2 years prior). He himself began soliciting the FCC stating that his "Nets" were being interfered with by this same CBer.

The FCC almost immediately responded and proceeded to pounce on a 14 year old kid (really his parents). Now I'm not saying that this is the case, however, things are NOT always as they appear to be. Just because someone is a Ham, doesn't necessarily mean their motives are pure. Of course this story made it to the illustrious QST magazine, however the part about the lady with the television was somehow forgotten in the printing of the story..................hmmmmmm.

The ARRL could put ANY spin on ANY article. READ the article carefully. It doesn't really say anything other than conjecture. I personally don't believe a word The ARRL says because they are so subjective, it isn't even funny.

Just think Bill, you made it to the big time, The ARRL will probably be using this article for code practice on 80 meters.

I'am a disabled Vet. and Ham radio operator and I'am trying to restore
a Old motorola CB Radio, Mod No.System 500 Am Usb Lsb
Finally after years of Looking, I found one at a hamfest ,And got it
somewhat Working , I need to know if anyone has a Manual Lying around ?
and the Mic will not work ,I have tried other Mics but I was told By a
Motorola tech that the mics on the CB Radio had a Built in preamp, and
Most mics will not work with it, Any help will be Greatly appreciated.

PS I don't think Motorola released info to the Sams Company ?

Thanks Don KA9QJG

You forgot to read the directions!! Average ratings is how it is calculated! For CB we are talking about an AM signal which, by definition, is calculated at 100% duty cycle. Single side band is calcuated at 20% duty cycle. So, again doing the math for you because it seems you are slow at this, assuming a 2000 watt pep signal and single side band at 27.185 MHz, the AVERAGE power out is 268 watts, not 2000--only 268 because of the 20% duty cycle--you still have to be 15.58 feet away to be safe under the regulations. Increase the pep power to 3000 watts and it will average to 402 watts and again assuming no antenna gain, the safe distance is 19.07 feet. This means that the antenna must be 19.07 feet away from the closest human or part of human to be considered safe. Do you get it now? You can't operate that kind of power from a mobile and be safe from rf exposure. No shit here about the car body protecting you--no shit here about other people in the car next to you can go to hell. It doesn't work that way. With that kind of power, you aren't even CLOSE to being safe. Any more questions? Your screen name says it all.

Oh, by the way, if one of the big kw+ stations you are scared of was operating legal limit on phone at 14.195 MHz, the normal amateur dx calling frequency, he could be just over 7 feet away from the business end of that antenna and be safe. RF exposure limits vary with the frequency. That's why it doesn't take much rf to cook that chicken in your microwave.

Duane,
If I wanted ssb I would get the PC-122XL(84.88) with a wilson
antenna(any of them are good) I ve own three and all have performed
flawlessly. If you want am only, I would go to http://bills2way.com
and get a PC76XL.(84.88) Best AM only uniden ever made.
The grant is an excellent radio dont get me wrong, one of the best
am/ssb mobiles ever made, but for basic communications, put the
difference in the antenna, it will be the best bet every time.

John Swisher

Here's a little tip for ya. If want to keep your car looking nice i would suggest not pissing
off to many truckers, or not pissing them off that bad. They just may make your car a sandwhich.

I have seen and used over a two dozen different makes of amps over the years. I have seen and used all three you have mentioned.
IMO, there is no better made amp today solid state than X-Force.

I am new to this CB business. I have purchased a used TRC-449, which
has 3 modes, AM, USB, and LSB.
Unfortunately, I have no idea what these mean or do.
I have not installed the radio in my car, because another radio I
borrowed had a box of some sort between the radio and the power
supply; this one doesn't.
Someone told me this was a noise suppressor of some kind and I don't
need one.
I would like to learn about this radio, its needs and capabilities
before installing it.

Thanks

Marty

That's a great answer for a legitimate question. :-(Grow up. If your use of the CB is only going to be casual, then a mag mount on the roof might be adequate for short distances, but the shorter ones aren't going to work well, and the longer ones will work better but get in the way. If you are thinking of something more permanent, consider the outrageous expense of a light duty trailer hitch mount on the back. Your car has plastic bumpers so it isn't possible to mount anything there anyway, but you need an electrical route to a chassis ground, and a hitch mount would offer you this, and would offer the opportunity to mount a longer, more efficient antenna. The mobile antennas generally require a counterpoise to work properly and that is normally the metal body of the vehicle.

No doubt? Are you sure? Maybe someone is doubting? :)

Also, you might want to let people know where you are, after all, Channel 2 on AM at 10pm.. won't get much more than locals.

Note the electrical wiring on the radio and wire it directly to the car's battery using multistranded wire no smaller than 14 gauge. Avoid anything like "speaker Wire", but try to find a pair in two colors so that you won't make a mistake and reverse the polarity. Fuse the positive wire just as it leaves the battery with a fuse no larger than 10 amps. Buy the best possible antenna your pocket can suffer because the antenna is twice as important than the radio itself in communicating. Route the coax from the antenna to the radio in such a way that it avoids anything at all related to the cars ignition system, and if possible, keep it away from anything else that is electrical. Borrow an swr (standing wave ratio) meter from a friend and check the value of the antenna when the radio is keyed. The less the needle moves the better, but if it stays under 2:1, the radio will tolerate it. Most antennas have some adjustment in their overall length, and the length of the antenna in large part determines the point of resonance which is what you are trying to achieve.

The radio offers you AM, upper side band and lower side band. Look at either side band as being half of the AM signal, compressing the information into a smaller area. A side band signal will travel farther, but fewer people have access to it and most local CB work is done on AM. Both are useful for what they do.

Don't worry about adding any filters to the electrical or coax until you find that you really need them. Since you are on the internet, go to www.fcc.gov and search the site for the Part 95 rules and take a look at them. These are the regulations which control operations on the CB frequencies, and you should at least have a passing knowledge of their content.

> Oh, by the way, if one of the big kw+ stations you are scared of was operating legal limit on phone at 14.195 MHz, the normal amateur dx calling frequency, he could be just over 7 feet away from the business end of that antenna and be safe. RF exposure limits vary with the frequency. That's why it doesn't take much rf to cook that chicken in your microwave.

Every microwave I've seen has at least 700 watts at 2,450 MHz bouncing around in a small metal cavity. I'll worry more about nutrasweet turning back into acid above 86 degrees. It causes acidosis and symptoms like lupus. But red dye #5 is bad for you in mega doses.

Rush LImbaugh is too liberal for my tastes, and he talks about himself too much. While he's right about some things,
he's really a "heat sink" where conservatives go and waste their time and energy listening to him avoid the REALLY
important issues ... such as the fact that
Whites are quickly being overrun, and will
soon be a persecuted minority in their own land if they don't wake the hell up and do something about it.

> That's a great answer for a legitimate question. :-(Grow up.

The advice you refer to is in response to my comment about playing with truckers. It wasn't bad advice, but I play nicely. They like it ;-)

I bought a K40 and a mag mount. I haven't gotten around to trying it out yet. I'll try to mount it on the roof, lower than I had the other one. The K40 should hold better. If not I'll try the trunk lip mount. A local CB shop told me that wouldn't work well because the trunk lid is aluminum. I thought it was plastic. In any case I'll try it.

I like the trailer hitch idea but my needs are modest. On the other hand I have a friend who would install it for the cost of parts...

Thanks for the suggestions.

Amy

I've got a Wilson 1000 mag mount on the top of my Tercel matched with a Uniden 76XLW with the modulation mods, but running at a legal 4 watts. The SWR is about 1.5-1.6 on all channels. The antenna performs fairly well.

However, I used to have a 12" shafted Penetrator II antenna on top. The SWR was comparable to the Wilson. Performance was likewise excellent.

I've noticed that the Wilson doesn't pick up as much of the engine noise through the antenna as the Penetrator does, which allows me to keep the squelch at a lower setting, thus allowing more distant calls to break through. Thus the reason I switched to the Wilson.

What I don't know is if the Wilson is giving me the same transmission/receive ability as the Penetrator. Do the Penetrators have a higher gain? Is this only because its a centerloaded antenna? I would think that the increase reception of the engine electrical noise in the Penetrator, that necessitates a higher squelch setting, would actually make my reception worse than the Wilson, thus making the Wilson a "better" antenna for my vehicle.

I'd like opinions/comments... but please keep in mind I'm not a "Power DXer" and wish to avoid any "baseloads suck" chatter.

Thanks.

-Skorzy

You think it is better than the davemade? What makes it better? The performance of both are close to identical. And as you know one was a direct copy of the other.

Agreed. G. Gordon Liddy is more to my likings. Ollie North is also good if his broadcast is available in your area.

Next "up close and personal encounter" with the FCC will likely be regarding his practice of marketing illegal amplifiers to CBers.

Toll and others: Regardless of how you feel about the legal ramifications of amplifiers, you guys HAVE to admit that it's REAL foolish to openly market these devices on a public newsgroup AND attatch your full name plus your amateur callsign to your postings AND do so while already under FCC scrutiny for violations in the amateur band. Not real bright in my book.

Hi all,
I'm wondering if anyone out there would happen to have or know of a
Cobra 2000 for sale, I would prefer a stock unit, and obviously one
that works i.e. all led's. also I'd like a unit thats in excellant to
mint condition with the external speaker.
```

: it
: does out of stainless steel, it other words copper has less resistance than
: stainless, therefor it moves electricity faster than stainless, if the
: >antenna was made out of gold or platinum it would be even shorter.

If copper conducts an RF signal "faster than stainless", then the antenna
would have to be longer - not shorter. Think about it.

Go to your local library and look in copies of the Radio Amateur's Handbook. The older copies have such antennas - I don't have a recent copy, but suspect they may as well.

do not buy a base loaded whip go for the center loaded whip
or a top loaded whip

people say a base loaded whip is quieter

that is becuse they can't hear any thing to start with

you will hear normal band cluter and with the squelch off
and the ANL off
and static any time of the day if not
the antenna is not working

Tinker,
All of the Texas Star Amps except the 75 watt modulator have a manual SSB
delay.
If you have a 225 palomar I have a mod to take the delay out and put it on a
switch(thanks to Jscotty at Scotty's radio). If you are interested in the mod
I will be happy to E-mail the details to you.

Newsgroups: rec.radio.cb

some say that real life is not calcs but
i had plenty of experience with them
that is why i took the time to figure out
why they did not work very well

this is why i will never waste my time
with a base loaded agen

take a 8 foot whip for simplisity that can be
devided in to 8 one foot chunks

the starting phase is at 0 at half the feed point current
the retern phase is makes up the other half
and we just want percentages real feed point resistance
is not of concern so lets make up a resistance of 4 ohms
and a radiation resistance of 1ohm per foot

ther for the input will be 4 watts at 4 volts and one amp
that should make calcs a bit simpler

._._._._._._._._.

first node which is the feed point
out going phase .5 amp at 0 degrees
incoming at .5amp at 0 degrees
toatal 1 amp

node 2
out going at 11.25
in at -11.25
cos,11.25 = .980

average .99 amp at one ohm =.99volt
.99 *.99 =.98 watts for number 1

node 3
out at 22.5
in at -22.5

cos,22.5 =.924
average .952 at one ohm =.952 volt
.952*.952= .906 watts for number 2

node 4
out at 33.75
in at -33.75
cos,33.75 =.831
aver .88 amp = .88 volt
.88*.88 = .77watts for number 3

node 5 the center of the antenna
out at 45
in at 45
cos,45 =.707
aver .77amp =.77volt
.77*.77 =.59watts for number 4

node 6
out at 56.25
in at -56.25
cos,56.25=.556
aver ..63amp =.63 volt
.63*.63=.39watts for number 5

node 7
out at 67.5
in at -67.5
cos,67.5 =.38
aver .468amp =.468 volt
.468*.468= .21watts for number 6

node 8
out at 78.75
in at -78.75
cos 78.75 =.2amp
aver .29 at .29 volt
.29*.29=.08 watts for number 7

node 9 top of antenna
in at 90
out at -90 (note phase reverses at open end)
cos,90 =0 amps at 0 volts
aver .1amp at ..1volt
.1*.1=.01 watts

chunk	output
1	.98
2	.906
3	.77
4	.59
5	.39
6	.21
7	.08

8   .01
total   3.936 watts about right takin acount fot
the rounding of hear and ther
1 to 4 output 3.246 or 81.15%
5 to 8 output .68 or 17%

3 foot base loaded whip
with no network at the base
just loading coil
.3 watts out or 7.5%
you can say that the swr
will make a current node at the
base of the antenna well lets look
50 ohms at .3 amp at 15 volts or 4.5 watts
in to 4 ohms
swr generates twice the current so input is
.6 amps so 16% but
the cerculating current is 12.5 times that
so you have 12.5 times the coil lost and
other losses so you end up obout the place
you started

and a whip with a network in the bottom
it will transform the 50 to 4 to drive the whip
but the cerculating current will be 160 times the
normal they state it will be 50% or more efficient
but with 40 to 50 amps cerculating current it is not likely
most likely about 10%
3/4 of the power will be lost in the base to car gap
and trunk lid mounts will nead 0 gage brade to connect
it to the frame
and lets not even talk about the loading coil losses
at that current
some companys just have nicrom wire for the network
that gives you about 50 ohms
why do you think they nead such a big base loading coil
that is so it can disipate the transmiter power
and receve is still about 8% even less now becus
of the loss in the network

on a two foot center loaded whip you get
about one watt out on the lower part
and the top basicly serves as a tuning
stub with only about .1 watts out
which givs you about 25% output
and that is on receve to

that is why bumper mounts are junk
becuse the lower 2 to 3 feet the of antenna
is renderd useless

ex the spelling

There is a delay for SSB, but on SSB you pretty much have to have some delay in the keying circuit or it will chatter because there is no carrier. The delay on the Texas Star is not as bad as some of the palomar amps are, But you shouldn't need any of this on AM as you probably already know this.

Why is it whenever someone speaks of anything illegal my name comes up?

I don't work on CB radios for a living.
I don't market anything CB or ham.
I don't sell anything that can be construed as such.
I don't work on linear amplifiers for anyone....

So, why is it that just because I answer questions for people, I am always
brought into the middle of the shit soup?

Buy a schematic of both radios.

Compare.

Your wrong.

The only thing that was different was that the base used a crystal filter,
and some of the mobile radios bypassed the Xtal filter with a cap.

That had nothing to do with TX of the rig... Only the RX selectivity.

Not true.

The coil type antennas will show more "gain" in the horizontal pattern than will a non-coil antenna.

The non-coiled will have more "apparent" gain than the coiled antenna when measured against a verticle reference.

All in what you want to talk. I have better results with a double coil Dr. Crow for skip, but the Black Al Capone and Triple Duece single coil work better locally.

Only when you push in the SSB switch. That is one of the functions of the
switch.

That will also show you the quality of the amp above the others on the
market....

Pretty shitty when a manufacturer won't spring for a dollar switch, eh?

Excuse the spelling, as well as the misinformation!

The double coil antennas concentrate more of the signal in the horizontal plane, argueably increasing the skip that the antenna can work (some people say that a horizontal antenna will work DX better.... I tend to agree, mostly because most noise has been proven to be closer to vertical polarization).

So, yes, the double coil will have more gain to a horizontal antenna, but the single coil will be better suited to a vertical antenna.

Hope this helps to clarify a bit, as well as dispel the myth that the other gentleman was attempting to cram down your throat.

What a bunch of bullshit.

The Wilson picks up less static from the engine because it is a DC grounded antenna, not because it has less "gain" than the Penetrator.

The Penetrator will be a little more widebanded due to mechanical and electric construction, but the Wilson will have a "quiter" RX due to the fact that it is a DC grounded antenna.

This fact lets the static "bleed off" rather than be propogated down the coax to the radio.

The Wilson base loaded antenna has become more or less the antenna to beat when talking about ANY type of mobile antenna.

You are obviously not very competent when it comes to RF today... Maybe for the days of 20 or so years ago, but so far everything you have said that I read today was wrong. Dead wrong.

Go back, bone up, read a book (learn to read if you have to first), then you can come to the newsgroup and propagate real technology...

Not antiquiated myths.

Those radios have no "over-SWR protection" in them.

The only type of protection that they have is overheat, and that is done through a simple thermister.

The problem that you are seeing is because of a higher than what is called for input impedance on cheaper or bad amplifiers.

A transmitter will put out 4 watts into a 50 ohm load...

It will not put out 4 watts into a 75 ohm load (way less, as a matter of fact, and this is a 2 to 1 swr).

Consequently, when driven into a 40 or 30 ohm load, the SWR goes up, but their is more current in the feedline to the box, resulting in greater drive!

     Yes, I am.

     Before Hollingsworth we all enjoyed ourselves and stayed
     to ourselves.  We never bothered anybody.  The only people
     that concerned themselves with us were the anal types
     that saw something illegal and had to stick their brown
     noses into it.  Now, if one of us gets too carried away,
     we get a warning letter or have to retest.  You'd think
     the pollbutts would be happy wouldn't you?  They're not
     and they never will be.  We still manage to say and do
     what we want within the confines of Part 97.  So, they
     tape every word we say so they'll have a record of any
     violations.  We have our hobby and they have theirs.
     It all works out just fine.

Hey now, he did ask a legit Question!!
For an Escort, just be sure the radio transmits clean, if it dont you may have problems with the onboard computer for your car. I've heard of that happening before with both hams and non hams.
(for clean, no spikes or spurios emissions, some could fool the computer into thinking theres a problem)
Hope this bit of advice helps you out.

Just curious, Would you mind if the covers were also bent at a local
fabricating shop then painted?
If looks dont matter you might be able to get better shielding, even better air
flow thru radio to keep it cool during heavy usage.

For that matter, a Rip-Shack mag mount would work better than
a thru-glass antenna. Put a cheap radio on a GOOD antenna.
You can always get a better radio later. A cheap antenna is
forever. (You'll be stuck with it!)

Who gives a sh!t? You sound like you own the NG.
I guess you'll be crying about bleedover next.

     I agree.  The regulator fix is easy and common knowledge
     these days.

> I run a 2950 in my truck. I've had it for 7 or 8 years now. I've taken

> that of another radio with high level modulation.

     Here, I disagree.  In my experience, you have to
     lower the carrier to 5 watts before you'll see
```

100% positive modulation on a scope. The modulation envelope peaks are alot more rounded too. The waveform doesn't look like a textbook AM modulation envelope at all. You can see the effect of the linear stages that the signal has been put through. Comparing tuned-up radios, the diffierence between a 2510 and a 2950 on AM using a scope or a monitor receiver is very clear. The only way to make a 2510 even come close is to reduce the carrier to the point where the maximum peak power begins to drop. That happens in the 4 to 5 watt range. At that point, you've got all the positive modultion you're going to get. The sound isn't too terribly bad, but the high-level AM "bark" just isn't there. I don't like the fact that you lose peak power when you lower the carrier below about 5 watts either. That compromises the performance when using CB amps that show symptoms of overdrive if the carrier is above 2 to 2.5 watts.

On the other hand, the 2510 will show higher peak power output with a simple tune-up on SSB than a 2950. They have a nice, stable SSB sound too. If a guy could handle the lower tech CPU with its lack of features, and is only interested in SSB, the 2510 (or Lincoln these days) may be a better choice for some than the 2950.

> The one thing that you do have to be careful of with a 2510 (and the President Jackson, which has virtually the same transmitter) is the power control circuit. The power control derives it's feedback from an SWR sensing diode, which allows the transmitter to back down the power when the SWR gets high, thereby saving the final. But an unpleasent side effect of this circuit is that under certain conditions, (such as the input matching of a amplifier) the feedback can be greatly reduced which results in the rig putting out too much power. This can cause overdrive of the amplifier, and the distorted sound you get when you have no forward swing and all back swing.

That's interesting. I've never noticed that effect. My backup radio is a Jackson. I'll have to run it into some loads other than 50 ohms to see how it reacts.

You'd figure the opposite of what you say would be true. On either side of 50 ohms, the control circuit should reduce the output. There shouldn't be a condition where the output increases.

The difference here is that Ranger offered it
themselves knowing that some hams are interested
in 10 meter FM repeater operation. As I remember,
it's spoken of in the owners manual. In other
words, I wasn't talking about a totally aftermarket
unit. However, since I've never followed it up,
there's nothing saying that Ranger ever produced
a custom PL board for those radios. There certainly
are no empty sockets inside the radio to ease the
installation.

Hello All: Looking for a Hy-Gain Penetrator 500 5/8 CB Base Antenna, in any shape or condation. I'll take new in the box, to a old one thats been up for thrity years, to a melted down mess from a lighting strike.

Look at   http://www.cbgazette.com/gaz2.html and click on "reader mail" in the left hand colum for a picture of a Penetrtor 500 5/8 CB Base Antenna. This is Woody World CB Radio site.

Thanks.

Jay in the Mojave Desert, its gettin under 100 degree's, better get ready for winter.

Hi all:

I have added more manuals to the list, there are approx.
8 on Portables, 24 on Mobile's, and 5 on Base Station's,
added to the existing page at the following:
http://home.att.net/~j.dow-kb2tlb/pages.html/servmans.htm

Also, if anyone is interested, I can make up Modulation &
Tuneup Guides, for any of the radio's listed, for onk\ly $6.15, shipped.

For other related CB info, please visit the following page:
http://home.att.net/~j.dow-kb2tlb/home.html/mypage.html

And for CB Fotofacts, visit the following, direct link:
http://home.att.net/~j.dow-kb2tlb/home.html/phfact1.htm

Tnx,
Jim/kb2tlb

     You're mixing voltage and current with power.  The
     equations aren't the same.

OOoohhhh....

Guess that hit home a little bit, didn't it!

What's the matter?  Not comfortable enough to take a joke that might
question your sexuality???

As for me being an idiot, I can guarantee that for the moral minority, their
are a lot more that send me email that like what I say, my technical
expertise, etc., etc., etc. than you morons.

So, as they say....  "To each his own".

Have a good day, and don't worry...  As you experience grows with woman, you
might just find out that you like them....  Like them enough to be able to
take a joke, ya moron!

>read today was wrong. Dead wrong.

i have had wilson antennas befor i have had a lot of experience with
them peaple do not under stand simple things just becuse you pay
more for it don't mean it is better i am quite competent with rf i repare
all of my own equipment including cars and vans we have not took a
vehical to a repar shop in over 7 years i have a old hw 101 heathkit that
when i got it only did about 1 watt i re tund it chaged all the old resisters
becuse they wer old carbon composision and had chaged value to the point
it wass useless it had it wass screwedriverd to deth by a dang cb'r
i will never be able to git the 29 to 29.5 segment working he was
tring to git it on 11 metters he also vaporised the 6146,s had to pay
50$ for a new set did not have any others around to put in

and 20 years ago i was only 3 therfor i would not know about that

i work on my own computer they mite be a bit out dated but they work
i like to see what i can do with the most basic stuf and how to get the most
out of it most people do not care about having a good antenna becuse
the cb channals are so cramed during the day that they can not tell the
deference
i have had may locals around hear come and ask if i could help them
they wer not able to git out over 2 to 3 miles
usaly runing some base loaded whip some times a k40 other times
a kmart no name two or three times a wilson 1000

i would just go to the house and git a spare 10$ antenna
that i get from jcwhitny slap it on the top and it blows ther wilson
1000 away
around hear ther is not much nois you can drive around
with the squlch of and never know it till you pass under a
noisy powerline
taking in to acount that the car is in good working shape
and not generating static on its own

some have just piched the 60$ base loaded antenna in the weeds
and no the antennas wer in perfict shape no broken coax or any thing

one dud could not talk over 3 miles when the antenna was installed
he whent home to test it i was on another moble becuse the base
antenna was down i had no amp in the moble and never had one
in it and never had a amp in the base station ether
when he was 5 miles and still perfictly readable he was serprised
when he was 10 miles away he was stuned when he was
15 miles away we was able to talk fine then some big skip came
in when the band opend up and bloted every thing out
if the skip had not came in we would have reached about 20 miles
max with the base up about 40 feet we could have got about 30 miles
i whent about my other dutys when he puled back
in the drive about 40 minits later and tryed to give me 80$ for my job
i stated the thing only cost me 10bucks he demanded me take 20
so to git the person to shut up i went oook when he was giting
in the pickup he stated ow yea hear is the old antenna
and throwed it on the ground and left i canablized

the wilson 1000and made a 6 meter moble out of it

electronics is my hobby and i am quite competent at it thank you not
i have ran the stuf on a antenna modiling program for kicks and
it spat out the same thing my calculations did

ex the spelling

That's rms voltage is .707 of peak. This .707 conversion factor is
referring to voltages or currents, not power.

>

you have to git over a 1/4 wave to git phase chage
the current mite be deferent but the phase is the
same

and the shorter the antenna the wider the mane lobe
ther is not any magical antenna that will git you grate gane
if you want to work skip git a 1/4 wave on the cennter of the
roof most likely a tripod mag mount if you do not want to drill
holes

or a 3/4 wave colinear but it would be 27 feet tall if you wanted
to work the real dx

the static that the radio hears is in its pass band (ie) +-5khz from carrier
if it bleads of that then it is also bleading off singnal which is at
same frequency the other dud,s signal is not any deference from the static
same frequency so the antenna should respond the same

he should take time to fix the nois problem that will help all the way around

Toll,
Would this also be the case if the Penetrator was attached to his vehicle
via a mag mount? Or were you assuming that the Penetrator had a hard
connection to the car body. I guess I'm assuming that the mag mount gives
the Wilson its DC grounding.

Dale.

I really do apologize, but I cannot respond to this.

I cannot understand what you are saying.

Next time you reply to me, please take the time to phrase your thoughts
completely and put down complete, grammatically correct sentences.

I still stand by my statements, though.

We are not talking about phase change, we are talking about polarization.

It is plainly obvious that you have an inkling of what you are talking about, but the words get all jumbled up, right?

Anyway, I hate to disagree with you, but two people have spent the time to actually MiniNEC the antennas (Xterminator double coil, a Francis, and a few others). Their findings corrolate with what I have said.

I wasn't so sure that I believed it, so I too the initiative to test myself.

I used a quarterwave (102" whip), a double coil Dr. Crow and a Black Al Capone single coil.

The Quarterwave was the worst performer into the flat side of my beam (A Maco M-103 is what I use for RX, choke fed at a hight of 72" to the boom), then the next worst performer was the single coil Black Al Capone, then the double coil Dr. Crow. The crow was about 7 pounds (into a Kenwood TS-440SAT for RX), the Al Capone at 4, and the quarterwave whip was near 2.

Then, on to the ground plane, a Penetrator 500 at nearly the same hight.

The results where damn near backwards from above..... The Black Al Capone was better into the ground plane, then the 102" whip, then the crow.... In that order.

I don't think that you can argue with measurements. I took these at 10 miles from the location of reading, so their was no near field strength readings or leakage into the coax. Power output was varied, and the mesaurements stayed the same (this was done to take into account any near field reflections from the vehicle itself, a 1996 Chevy Suburban.)

>
> and the shorter the antenna the wider the mane lobe

You mean the shorter the radiator, the less concentrated the main lobe will be... Semantics, but you can take your words and construe them to be whatever you want them to be.

> ther is not any magical antenna that will git you grate gane

Sure their is.... The 8 element beam in my backyard! I GUARANTEE you it will outperform your 102" whip on 27.025!!!

> if you want to work skip git a 1/4 wave on the cennter of the
> roof

Not from my real world measurements, nor from my real world experience! The 102" whip, while being a good all around reference, is not the end all for antenna performance.... You have to weigh what you want to do. For someone who just wants to talk to his friends, mobile to mobile, the Dr. Crow would suck, but from a skip standpoint, it is DB ahead of the 102" whip!

most likely a tripod mag mount if you do not want to drill
> holes

A mag mount for a 102" whip?

Your putting a choke on the feedpoint, right?

Otherwise, you just made a nice bazooka antenna!

>
> or a 3/4 wave colinear but it would be 27 feet tall if you wanted
> to work the real dx
>

A 3/4 wave colinear......

So your going to stack 3 1/4 wave antennas? Why?

The lobe pattern would suck at HAAT!

The static that the radio hears is in its pass band. (in another words) +-5khz
from
the carrier
If it bleads off that then it is also bleading off singnal which is at
same frequency.
The other person's signal is not any deferent from the static.
It is at the same frequency so the antenna should respond the same
He should take time to fix the noise problem.
solving the noise problem will help all the way
around.

DC building up on the coax will not bother the

radio unless it gits very high then it will just blow
it up.nuke it. friy it or any way you want to say it

dc and other wide band noise should be toataly filterd
out.

if you hear noise at other frequecys then the radio is under
filterd and otherwise junk git a good radio

If the noise is in the pass band then the noise can only be
stoped at the place generating it.

> i have had wilson antennas befor i have had a lot of experience with
> them peaple do not under stand simple things just becuse you pay
> more for it don't mean it is better

Your right.... But, in the case of the Wilson, it is one of the antennas
for all around general use that is the one to beat!

Sorry, but you cannot argue with this fact.... People have been using it
for a reference for years.....

Why?

Because it performs great! I own two, but I don't run them. I use one for a loaner, and the other for rental cars on vacation / work trips.

I have a garage full of mobile antennas, and typically run the best that is available at the time.... The Wilson is still that for a general purpose antenna.

> i am quite competent with rf

I don't believe you. Everything you have said today has been rebuffed by more people than you could care to imagine. Hell, even the Professor would argue some of your points!

>i repare all of my own equipment including cars and vans

O.K., so you are an auto mechanic. What the hell does that have to do with RF? We don't use spark gaps anymore!

 we have not took a
> vehical to a repar shop in over 7 years

That means nothing to CB radio.

 i have a old hw 101 heathkit that
> when i got it only did about 1 watt

Then the comment you made about the 6146s below is false. If a tube has been vaporized, the gold is stripped from the grid, and their can be NO emmisions, making power output absolutely impossible.

Once again... Proved wrong.

 i re tund it chaged all the old resisters
> becuse they wer old carbon composision

I have a SB-220 and a DX-100 that is all original, sans a couple mods to the SB-220 for input and bias. Other than that, they are all working with the original equipment. Same with my Johnson Viking (1953) and my Hallicrafter HT-41 amplifier. If you would like to compare antique radios, I am sure that I would win... Maybe not, but I think so.

 and had chaged value to the point
> it wass useless

Then the resistors had been overheated. BADLY!!!! Resistors don't change value with age... Capacitors do. Do you know the difference?

> it had it wass screwedriverd to deth by a dang cb'r

OOOHHHhhhhh!!!! Now we are "dang cb'r"s, eh? Nice to know that the Hambobo comes out in you, too!

> i will never be able to git the 29 to 29.5 segment working

Why not? If the VFO is working at any segment, you should be able to get it working anywhere else. The only thing that can go wrong is parts, and their is not a part in the HW-101 that is not still being made today! You may have to modify the capacitor, but that is about it.

I think we are seeing more of your inexperience or inexpertice at work here!

he was
> tring to git it on 11 metters

And that is fairly easy to do. Change a couple Xtals!

Whoomp, there it is!

> he also vaporised the 6146,s had to pay
> 50$ for a new set did not have any others around to put in

I addressed this earlier. You don't know what a "vaporized" tube is.

Could be that he mistuned it, and that caused problems, or the 6146s could have been old (they are getting up their in age, ya know????)

>
> and 20 years ago i was only 3 therfor i would not know about that
>

Great. You are 23. You still have a lot to learn.

> i work on my own computer

Once again, what the h@ll does this have to do with the CB radio?

they mite be a bit out dated but they work

Great. I am a Senior Network Engineer and report to the CIO of a nationwide real estate management firm. Does this mean that I can work on a CB radio?

> i like to see what i can do with the most basic stuf and how to get the most
> out of it

Great. I think that we all do that.

most people do not care about having a good antenna becuse
> the cb channals are so cramed during the day that they can not tell the
> deference

That is utter BS. People want a good antenna during the bad times because it is a lot easier than a linear! Antenna sales are higher during the peak sunspot cycles because of new blood to the hobby as well as people upgrading.

Hell, at 23 years old, I doubt that you could recall the last sunspot cycle!

> i have had may locals around hear come and ask if i could help them

People inexperienced always ask people with slightly more experience! That does not make you a technician, though! Far from it, as a matter of fact.

> they wer not able to git out over 2 to 3 miles

That is bad, depending on what they where running.

> usaly runing some base loaded whip some times a k40 other times
> a kmart no name two or three times a wilson 1000

If they where unable to get more than 2 or three miles from a Wilson, they needed to have a real radio put on it, the coax replaced (broken) or the SWR set. I regularly talked from Las Vegas, Nevada to St. George Utah with a 667 on a Wilson to my base in Utah. REGULARLY!

I could also talk from Mesquite Nevada to St. George (40 or so miles) with a barefoot radio. 148FGTL.

You are full of crap, or REALLY don't know what you are doing.

>
> i would just go to the house and git a spare 10$ antenna
> that i get from jcwhitny slap it on the top and it blows ther wilson
> 1000 away

You are full of shit. Unless they had a broken coax or antenna, the Wilson would have gotten farther than 2 or 3 miles, especially if what you say next is true!

> around hear ther is not much nois you can drive around
> with the squlch of and never know it till you pass under a
> noisy powerline

So, then, the Wilson would have been an even better candidate! Being a DC grounded antenna, it will pick up less engine static, thereby reducing the noise level even more!

> taking in to acount that the car is in good working shape
> and not generating static on its own
>
> some have just piched the 60$ base loaded antenna in the weeds
> and no the antennas wer in perfict shape no broken coax or any thing

Sorry, but your full of shit. Gotta call a spade a spade, and you are full of shit.

>
> one dud could not talk over 3 miles when the antenna was installed

he should have shot the person who installed it then, because they ripped him Hoff!

> he whent home to test it i was on another moble becuse the base
> antenna was down i had no amp in the moble and never had one
> in it and never had a amp in the base station ether
> when he was 5 miles and still perfictly readable he was serprised
> when he was 10 miles away he was stuned when he was
> 15 miles away we was able to talk fine then some big skip came
> in when the band opend up and bloted every thing out

Sorry, but skip does not "roll in" in a matter of 5 minutes. Not the magnitude that you are talking about.

Once again.... Full of shit!

> if the skip had not came in we would have reached about 20 miles
> max

Pure conjecture on your part. How can you tell me how it would have worked if you didn't do it?

>with the base up about 40 feet we could have got about 30 miles

Pure conjecture on your part. How can you tell me how it would have worked if you didn't do it?

> i whent about my other dutys when he puled back
> in the drive about 40 minits later and tryed to give me 80$ for my job

Right. I have a nice piece of surfside property in Nebraska for ya, too!

> i stated the thing only cost me 10bucks he demanded me take 20
> so to git the person to shut up i went oook when he was giting

What does "oook" mean? I couldn't find that dictionary definition anywhere...

Sorry.

> in the pickup he stated ow yea hear is the old antenna
> and throwed it on the ground and left i canablized
> the wilson 1000and made a 6 meter moble out of it

So, the ignorant shit that came to you in the first place took a brand new antenna and threw it on the ground after you replaced it with a 10 dollar pile of crap?

Sounds like you two are a match made in heaven! The idiots leading the idiots!

Why wouldn't he just take the antenna back? Wilson offers a guarantee!

Wait.. I bet you never told anyone about that, did you? Makes for a nice antenna farm for free.

>
> electronics is my hobby and i am quite competent at it thank you

Not by what you say here. In the last 15 minutes, I have had 10 messages delivered about you, and not one defended you.

Guess what that means? Most of them where from people I consistently fight with, too!

Your competence is only in your head....

not
> i have ran the stuf on a antenna modiling program for kicks and
> it spat out the same thing my calculations did

What modeling program did you use? I am just DYEING to know!

>
> ex the spelling

how can I... Usually I have to attempt to decipher what the hell you mean, and I counted not ONE period in the entire diatribe that you just spit out.

Sorry, but I have to put you in the same category as JScotty@aol.com and CBKing.

You are just barely above the illiteracy mark, and have a beginners relationship with electronics fundementals.

That does NOT make you competent in any way, and you have surely shown it!

Sorry, and have a nice day.

Please purchase a copy of Bill Orr's Radio Handbook and the ARRL Handbook for the Radio Amateur as well as the ARRL Antenna Book.

Once you have done this, and can tell me the correct way to built a 4CX350 amplifier, I will be able to converse with you. Until then, you are nothing but an illiterate shadetree mechanic that believes he knows what he is doing with a CB.

Sorry, truth might hurt, but I am tired of your babble.

> The static that the radio hears is in its pass band. (in another words)
+-5khz from
> the carrier

WRONG!!! That would be classified as Adjacent Interferience!

Static is the noise that is naturally generated by nature, given off by other electromatic forces or generated by vibration from two metal parts.

Static has NOTHING to do with the selectivity of a receiver!

I have given you more credit than you deserved. I thought that you had enough sense to at least understand the basics of radio theory. That comment above proves me wrong.

> If it bleads off that then it is also bleading off singnal which is at
> same frequency.

WRONG!!!

The static is a more or less wideband signal. The DC grounded antenna uses the choke effect of a coil to keep the wanted signal from ground, but keep the feedline at DC ground potential.

This also serves to match the antenna to the "50 ohms" feedpoint impedance.

Once again, it has nothing to do with wideband static. It is a "notch filter" of sorts, that only passes a small amount of frequencies, with a Q of less than one in some cases.

> The other person's signal is not any deferent from the static.

WRONG!!!

The signal is completely different from static.

Your posts are no different from static, though! Both should be considered trash and thus useless!

> It is at the same frequency so the antenna should respond the same

WRONG!!!!

Obviously you have never seen a spectrum analyzer, right?

You would see that static usually stretches from DC to near daylight!

Get a good 5 or 10 gHz Spec-An, and you will see in the time domain what I am talking about!

Until then, you know nothing about the subject!

> He should take time to fix the noise problem.

Well, something we can agree on. However, this is not always economically feasible.

> solving the noise problem will help all the way
> around.

Yes, it will, but see above.

>
> DC building up on the coax will not bother the
> radio unless it gits very high then it will just blow
> it up

DC on the coax will do nothing to most modern transmitters as they are capacitively coupled to the antenna. But, you don't know the difference between a capacitor and a resistor in another thread, so I forgive you for this statement.

DC grounding passes the majority of the widebanded static component on the medium of travel that the RF takes and sends it straight to ground.

It has NOTHING to do with protecting the radio from DC building up on the antenna.

.nuke it. friy it or any way you want to say it
>
> dc and other wide band noise should be toataly filterd
> out.

O.K., by what?

How do you filter DC, Einstein?

>
> if you hear noise at other frequecys then the radio is under
> filterd and otherwise junk git a good radio

Not necessarily.

You could be hearing images, injection noise, phase noise from the PLL, etc. Their are many reasons to hear noise.

And their are many radios that vary in their ability to reject adjacent frequency interference.

I doubt that anything you own would touch my Kenwood with the Collins filter in it, though.

let me know when you are ready to step up to a good radio.

>
> If the noise is in the pass band then the noise can only be
> stoped at the place generating it.

Duh.

Static is not filtered out in the IF sections of a receiver.

Sorry, but you have absolutely no idea what you are talking about.

The center lead and the sheild are DC connected on a wilson.

The center lead and the shield are not connected on the Penetrator.

The Penetrator is designed to work as a different type of antenna.

He gets more noise because of the additional surface area on the Penetrator
and the fact that static is not bled off the antenna before it hits the
feedline.

many people do not even Know what a collinear is

a collinear is a 1/4 wave below a 1/2 wave with

a 1/2 wave matching stub so the 1/4 wave and
the 1/2 wave are in phase you can play with
the matching stub to rase and lower the mane
lobe

Yadda, yadda, yadda...

If you want a horizontally polarized signal then you should use a vertical antenna, right? Even if you are in the mobile?

You ass. If you want a horizontal signal, use the antenna that produces it!

Line radiation would have VERY little to do with it in a mobile situation.

The majority of the line is INSIDE the vehicle, which serves to shield any incidental radiation from the outside of the feedline.

It would NOT have an effect (or a very pronouncable one) at 27 megs in a mobile.

Your fishing, or spewing something that you don't know anything about!

2.
> >
> the beam was on a tower and not in the mane loab

Do you mean "Main Lobe", or do you mean "Main Lab"?

Labs mean shit to me. I deal in real world tests.

The main lobe of the quarterwave antenna would most certainly be in the path of that beam at the distance we tested at. 27 megs is not a "ground hugging" area of radio spectrum.

Sorry, once again, your arguments are totally wrong.

>
> the 1/4 wave has a tighter pateren which was going under the beam

Bullshit.

> the shorter antennas have a wider mane lobe so more rf reached the
> beam that was higher than they wer

Bullshit.

The coil on the antennas serves to concentrate more RF energy at a pronounced area, and also serves to propogate the signal in the H plane more than it does in the E plane.

This has been mathematically proven, proven in real world tests, proven on a NEC based modeling program AND PROVEN AT THE WILSON ANTENNA RANGE IN ST GEORGE UTAH! I lived down the street from the test range. Interesting place, and I did learn a lot by watching what they did.

You could learn TREMENDOUS amounts by shutting your damn mouth and listening to what people on this newsgroup said!

>
> not to point out that a horisontal beam can not hear a vertical antenna

No, that is not true.

On average a vertically polarized signal will be close to 20 dB lower when received by a horizontal antenna.

Since the double coiled antenna was heard better than the whip, that would tend to back up my statements and prove you a dumb ass.

Both of the above are true. And the statement about the polarization shift is basic textbook knowledge.

> if you want to make a test rotat the beam to vertical polarization

Why? I don't deal in verticle polarization. I talk DX, and DX is better (usually) when you are horizontally polarized!

> >>
> >> and the shorter the antenna the wider the mane lobe

You keep talking about this. I agree, but you, the dummy that you are, can't seem to get it through your head that on a mobile, at 10 miles or more, it doesn't make that much of a difference!

Not in the difference between a 5 foot and 102" antenna! The lower static noise level on a DC grounded antenna would actually tend to cancel out the effect of the "mane loab" as you so eloquently put it!

> >
> >You mean the shorter the radiator, the less concentrated the main lobe
will
> >be... Semantics, but you can take your words and construe them to be
> >whatever you want them to be.
> >
> if you look at a field pateren a 1/4 wave will generate a omni

Any monopole or its derivatives will be omnidirectional in the E plane.

> the shorter the antenna the wider the omni and less peak field strength

Not so. The shorter the antenna, the -3dB points change.

I can argue the same point you are...... If you are looking to have the maximum signal at 45 degrees from the feedpoint, then a 1/4 wave monopole would suck!

So, before you go spouting off what you read in Lou Franklin's books, I would go reread them, and gain a little better understanding of the fundementals of RF propogation!

> >> ther is not any magical antenna that will git you grate gane

And so am I.

You are the one that says that this 8 dollar JC Whitney antenna has more gain than any other antenna that you have ever found! Not me, not anyone else.

You and only you seem captivated by this "mythical" antenna!

>

I don't care what many people know.

I know what a colinear antenna is, and you gave a book example. A colinear antenna does not have to have 3 quarter wave sections, it can have as many sections as you want, and they do not have to be stacked vertically, either!

I guess you read that in the latest issue of QST or something, right? Big word, thought you would throw it out their and impress someone that you know what a "colinear array" is?

Big deal. The people at Solarcon also figured out what a colinear array was, and their antennas SUCK!

More yadda yadda yadda gibberish put out to impress someone with his mina bird tactics.

Please stop responding. Your embarrassing yourself in front of the entire newsgroup.

I will not respond to this thread under you any longer. It has been proven that you are wrong and you fail to see the light.

I give up on you.

You have no idea what you are talking about, have an incomplete thought process and cannot put together a complete sentence.

It is hard enough to have to attempt to regurgitate basic theory, much less attempt to put it at a 3 year old level so you would understand it.

Not to put you down, but plain English seems to be the only thing that you are capable of understanding.

Bill ,
This is a kind of setup that I would like. I would like an almost instant
unkey.
So what kind of setups do you run ?
Thanks,
Tinker

That delay is caused by the transmit delay in the amp. You need some relay delay to avoid dropout during those periods between words while you are transmitting. If you are missing some receive time the RC/RL time constant on the delay circuit is too long.

If you want a reliable method of communication, forget cb...
The conditions sometimes make it difficult to talk to someone who
is only a few miles away.. However, if its just for fun then go for it.

A friend had one of these some time ago and it performed well for him.
Yes they are rugged and compared to the Wilsons, cheap. If the antenna
is worn out and you have to replace, yes, try to find a Wilson at a good
price. Just to replace it for an improvement in performance? I don't
think there would be that much difference to warrant a swap.

some of the mobile radios bypassed the Xtal filter with a cap.

>That had nothing to do with TX of the rig... Only the RX selectivity.

Interesting... reason being is that I thought the receiver on the 458 was crap compared to the 449. I modified the 458 and overall it was a weaker performer--like some piece of <McMuffin> Midland or something...

: somewhat Working , I need to know if anyone has a Manual Lying around ?
: and the Mic will not work ,I have tried other Mics but I was told By a
: Motorola tech that the mics on the CB Radio had a Built in preamp, and
: Most mics will not work with it, Any help will be Greatly appreciated.

There are at least a couple of people who sell all sorts of radio and
test equipment manuals. Unfortunately, I do not recall their names or
e-mail addresses. It may be possible to find out by doing a search on
deja news - looking for "manuals". You should only get a few tens of
thousands hits.

There is nothing magical about preamplified microphones. The hardest
part is getting the wiring correct. One caution - if the Motorola was
preamped, then it might have derived its power from the radio, rather
than from a battery in the mike. If that is the case, then you would
want to remove that voltage before hooking up a battery powered mike.

: That delay is caused by the transmit delay in the amp. You need some relay
: delay to avoid dropout during those periods between words while you are
: transmitting. If you are missing some receive time the RC/RL time constant on
: the delay circuit is too long.

Such a setup is only necessary when you are using rf driven switching of the
amplifier. It is the cheap and simple way to do it, as no modification of the
CB radio is needed.

Far better is a dedicated switching circuit. Key the mike and the amp keys with the radio. Pause while talking, and the amp stays keyed up. Unkey the mike and the amp immediately unkeys.

I would not run a linear any other way.

i can't say that your friend was wrong about the mic pre-amp and i could be wrong here but i do know that on a lot of the non-mainstream cb's, they used crystal mics which would make a dynamic mic from most other radios useless if this is the case with yours.
non-mainstream doesn't nessessarlly mean a bad thing.
what i meant was that some radios out there wern't cloned much like the johnsons and motorolas and were not very generic in their parts choices.
just something to check
good luck
jeff

check the supply voltage / regulator circuit to the PLL.
check the same for the voltage to the varactor to the VCO also.
another thing, who ever opened up the slider for 20 khz, may be over loading
the varactor circuit and other associated circuitry there. GENERALLY speaking,
you don't want too much more than 8 or 9 VDC on the varactor diode.
good luck

NNNNNNNNOOOOOOOOOOOO!!!!!!!!!!!!

just fancier that way thay sell more for higher price
some of the dual coils i have seen have
the loading coil to close to the base
only about 3 to 4 inches they are as
close to base loaded whips as you can git
and still be called a center loaded whip
try a antenna with the coil at lest half way
up the whip
having large coils will not make it good
they are mostly loading coil and
very litle antenna

>
>Thanks.
>
>-Skorzy

i can not help it   BUT they DO
the weaker stations on the base loaded are above the engine
noise a certain db amount

on the center loaded or even a top loaded antenna the engine
noise will be higher becuse of the higher antenna efficiency
but the station will still be the same db above the noise

be careful with wording loaded moble antennas have no

positive gain but negaitive gain
what ever antenna gits closer to the standerd 1/4 wave
it is beter to use efficiency as compared to a 1/4 wave

radiated signal is higher the closer to the feed point
if you take a 8 foot whip and cut it up if 1 foot long chunks
hear is the toatal percent out put as compared to a 1/4 wave
whip

#8	1%
#7	2%
#6	3%
#5	8%
#4	18%
#3	20%
#2	23%
#1	25%

feed point

a base loaded three foot whip has only the top
three feet so it is only 6 to 8% efficiency
it is a tad higher that speck becuse the swr
produced a current node at the antenna
wich shuves a litle more in

center loaded two foot whip hase one
foot of botom and one foot off top so
it is about 25 to 28% efficient becuse of
the current noad

the higher the loading coil the higher the efficiency

some base loaded antennas have a matching network
at the base wich shuves about 40 to 50% of the power
into the whip but the receive is still about 6%
even less now becuse of the loss in the network

and the center loaded whip is still 25% efficiency
on receive

spend the time trying to solve the engine noise
and less on ways to git out of it

What you quoted here means nothing in the context of our discussion.

A tuned-up AM-only radio will develop much more energy in it's sidebands as will a tuned-up AM/SSB radio. If you're anything of a CB tech you know this. The reason why is that AM-only radios modulate the RF driver and final collector current through the primary of the audio output transformer. The transformer winding adds an autotransformer effect that can't be had using a transistor-based modulator like the SSB radios use.

Hello

A new software shareware of count of Qth locator under Windows98 (version 32bits).
The software permits the count has the aide of Qth locator or some geographical coordinates the position of a
station. He gives like results: the distance, the azimuth of the antenna, the geographical coordinates, the QTH Qth locator, the country, the city.
One could see on a geographical map, the position
of the station with possibility of zoom. He possesses a data base also with all
the capitals, and country of our old planet as well as the prefixes of the radios amateurs (possibility
of modifying this data base)
You could see the software and download the version shareware has the following address:
http://f1usc.click2site.com/

To soon
All the Best, 73's

Jean-Philippe

I don't agree. One board is as good as another regardless
of what model radio it ends up in. The specs didn't vary.

> *You*
> probably were one of those people who said "Cobra HAS to be better than Radio
> Shack."

Again, you're wrong. I make qualitative judgements based
on the chassis rather than the model. To me, the 139 and
the 449 are the same. The reasons why one may sound better
than another are not related to the brand or purposely varying
the quality of the board because it will end up in one model
or another. That's the stuff myths are made of. The reason
yours sounded better, if that trully was the case, was because
of tuning differences and accessory (microphone, amplifier, etc.)
differences.

There's one point we both agree on.

hello 11meter fans, i am looking for a case for an older Cobra 148GTL,
mine has been drilled on both sides for diffrent mounts, and i would
really like to restore it to a good look again. anybody have a dead 148
they can scrap the case skins off or know where i can get a set? thanks!

So, what? It has no advantage over the
simpler techniques used by CBers today.

You'll eventually realize that.

> If you have tried the technique
> and been unsuccessful in realizing any true
> advantages or results, have you ever entertained

As applied to high-performance CB, SCAM
has no advantages--you're just not advanced
enough to know that yet.

> Or is it because you already
> "know it all", and this is what is preventing
> you from understanding it any further?

From what I've read of yours, I'm alot
less a "know-it-all" than you are.

> You both need to learn how to relax.

And you need to learn how to open your mind
to concepts that are not in the ARRL Handbook.
You also need to learn how to prove or disprove
what others say through personal experiment
rather than by posting inapplicable quotes
from old textbooks.

That's not what the picture of you from your
site or things you write portray.

> but then again.............
>
> "You Don't Know Jack"!

I'm certainly glad of that.

Besides, if you've seen one closed-minded,
mediocre tech you've seen them all.

If you're looking for a true, powered, peak-reading meter, the SX
series isn't it.  In the same genre, the Mirage MP-1 is a powered
peak-reader that covers the HF range.

Toll Free wrote:

> The problem with running caps is that they are EXPENSIVE!!!!
>
> For the gentleman that had a pair, it would hurt nothing (and I will get into this later, as this is a qualified statement!!!) to add the caps...
>
> However, if you are not overcharging your electric system (running 19 volts on a pair of golf cart batteries!), a cap does not do much good at all. Sure, it will filter out the <<slight>> bit of ripple present on the rectified DC, but if you have enough battery reserve, this will be done at that level, anyway.
>
> The other thing to watch out for with caps is the AC RF component on the DC lines.... It is not uncommon to see many volts (sometimes nearly a hundredin the case of a large amplifier) on the DC lines. If you are running a 35 VDC cap, what happens....? Crackle!! Fizz Fizz.... Your car fills with a putrecent smoke, your car stinks, and you buy more caps...
> Most people are going to run a car audio capacitor, and that makes for low voltage ratings... On the order of 25 to 35 VDC... Exceed this rating, and

> poof..... Problem city!
>
> If you are going to run a mammoth alternator, and an external rectifier, then yes, you can go with a complete capacitor system.... Their is an inherent problem in doing this, too...
>
> 1. Not many people know how to hook up a 3 phase AC to DC rectifier...
> 2. Their is a voltage "overshoot" when you unkey the amplifier. We use the cap / alternator method on some large systems here in Texas, but their is always a problem with the period of time from when the field completely collapses in the alternator and the time the amp unkeys... The current draw of the amplifier dies off, and then the voltage overshoots the threshold set by the regulator... This has been known to fry 2879s before.
>
> The cure... The Dead Motor Maul. That is what we use. For people who don't want to spend the $$$ on the Dead Motor Maul, a couple batteries in parallel to the electric system will work, but the voltage overshoot is still their.
>
> So, for the average Joe to want to run caps... It can be done, but rarely, if ever worth the effort. For a competition user, yes, it can be done, but remember, you don't get the luxury of battery reserve... And that battery reserve means a lot when you are running anything bigger than 8 transistors! Translate this into Alternators, alternators, ALTERNATORS!!!......... The DC current has to come from somewhere.
>
> Now, on the flip side, to the battery method...
>
> Pick the voltage level that you want to idle at, in 2 volt increments..

> 1. 14 volt system, use a bank of automotive batteries (although I have been trying out a Gell Cell pack... Using batteries for a commercial UPS system, I have outfitted 5 batteries in my Suburban.. at 35% charge, I am able to pull 1100 amps out of them for short bursts (each battery, mind you) at 11 volts. Great for keydown useage!!!). Use the rule of thumb I gave earlier, and this will work.
>
> 2. 16 volt system: Use 2 8 volt batteries. They make a golf cart battery, but that is not the best. Their is also a 8 volt battery that the old Model T era cars used. It is a good battery, but not very good at high charge / discharge rates... Fails earlier than other battery types. The best 8 volt batteries that I have found are the ones that are classified as a "Tug Bat" battery. They are prevelant here in Houston (international shipping port), are rebuilt due to the demand from ships, and hold a HUGE amount of current. Also, they seem to take being abused better than any other battery I have seen. I highly recommend them for 8 volt useage.
>

Set the AM dead-key to 2 watts (VR10 adjusts it).

> Should I have it peaked by the local shop or leave the power stock with
> the mod limiter in tact?

If you have a decent wattmeter you should be able to set it up satisfactorily yourself. You have to trust in your own ability. If you don't feel good about doing the work yourself, have the shop do it.

There's not much you have to do on that radio to tune it up and set it to run an amp. You don't need to remove the limiting device itself, just adjusting the pots will do. Set VR5 for max modulated power on AM; set VR6 for max power on SSB; tune L26 for max modulated power with radio set to channel 19; set VR10 for a 2 watt AM dead-key with no modulation. That's all there is to it.

> The amp and antenna setup that I will be using
> with the Uniden is a Silver Eagle 200 and an X-terminator II.

The Silver Eagle 200 is an economy model amp that doesn't like seeing alot of dead-key power on AM. Make sure to limit the dead-key to 2 watts if you're going to run it on high. It's an unbiased amp (technically Class C) so don't worry if it sounds somewhat distorted on SSB. If you can, only use it to initiate a SSB contact then turn it off if you think you can maintain the contact. Also, those amps can be unstable. Check the output SWR (between the amp and antenna with the meter as close to the amp as possible) to make sure it's not too high (above 3:1) with the amp on.

> Thanks

You're welcome. Good luck.

     You know the old saying: "You pays your money and you
     takes your chances."

     Have you ever talked to any old men when they're not
     far from passing away?  They rarely regret anything
     they did.  What they regret are the things they
     didn't do and the chances (with potential payoffs
     in whatever areas) they didn't take.  To say you
     always played it safe and you never never broke a law
     when you're in that situation won't be very comforting.

It's outside the scope of this newsgroup to explain the process in a
step-by-step manner. Here's a link to a site where you can buy
reasonably priced info and kits to make that conversion come together:
http://www.cbcintl.com

Good luck.

Bill, re:

>>The fact is that *Uniden* made these radios to various different similar specs and some were better than others.

>I don't agree. One board is as good as another regardless of what model radio it ends up in. The specs didn't vary.

Sure they did. The boards weren't identical. For some reason, Cobra had them stuff other crap in there which screwed up the modulation when you tried to peak it. For that matter, the TRC-458 (base version of the 449) was a crappier version of the 449 or the 139XLR...

>Again, you're wrong. I make qualitative judgements based on the chassis rather than the model. To me, the 139 and the 449 are the same.

Similar, but not identical...

Is anyone using SSB in GA these days. I am trying to revive some in
SSB but I haven't even been able to contact anyone yet on SSB.

What are the popular chanels to use in the SE?

If anyone is currently or would like to be using SSB in GA please join
my SSB_CB_Atlanta mailing list at:

I seriously doubt that the potato would produce enough electricity to
run a CB radio. The contraptions that I have seen make use of the
potato power are usually LCD clocks.

As far as positive and negative, either nail should work for either
polarity.

Well let me tell you up here in central MA it's going to
drive the locals absolutely NUTS! Channel 2 is "their"
place, and they are a weird mix of drunks, elderly, and
teenagers who all answer to and worship a lady with a
voice like a foghorn named "Mama Sweet."

She's the only one who has a linear and wait until she
hears this keydown and tries to lecture "those bad little
boys."

Oh, and add-on extra. That's different. Yea, and you can also add a
speech compressor too, as an add-on.

Any radio can do PL tones, with the addition of a PL encoder board, such
as a Com-Spec unit.

Two things. First, I've seen more of my share of bad 2950's. That being said, most of the problems with the 2950 revolve around cold solder joints on the chassis mount regulators.

I run a 2950 in my truck. I've had it for 7 or 8 years now. I've taken care of the solder joint problems, and other than that, the rig has performed flawlessly. It does have a poor noise blanker, and the adjacent channel rejection is less than some other radios like a Uniden Grant. But I rarely find myself in a situation where bleedover is a problem.

> radios. They especially suck when it comes to
> AM modulation.

I find the audio of the 2510 to be just fine. You just have to keep the carrier level to less than 15 watts, and you'll be ok. On the scope, you cannot tell the difference between the 2510's low level modulation, and that of another radio with high level modulation.

The one thing that you do have to be careful of with a 2510 (and the President Jackson, which has virtually the same transmitter) is the power control circuit. The power control derives it's feedback from an SWR sensing diode, which allows the transmitter to back down the power when the SWR gets high, thereby saving the final. But an unpleasent side effect of this circuit is that under certain conditions, (such as the input matching of a amplifier) the feedback can be greatly reduced which results in the rig putting out too much power. This can cause overdrive of the amplifier, and the distorted sound you get when you have no forward swing and all back swing.

Here's some news: The new RCI radios should be here before XMAS. The RCI-2990DX will be reviewd in the upcomming NOVEMBER issue of Popular Communications. It's main diference from the original 2990 is that it Receives 24-31.999 rite out of the box, and XMITS on the 10 & 12 meter ham bands (I'm

sure there will be a "mod" to make the 11M recieve only portion also XMIT!).
There will also be the 2950DX 10&12M similar "dual bander", and a 2970DX too!
Thats all for now..................John

Thanks to all who have responded. I have chosen the PC-122XL because I want SSB and a front microphone jack. The only other Uniden would be the Grant LT and it is almost twice as much money.

I haven't decided on an antenna yet. I have a Dodge Caravan that I will be installing the CB in and would not like to drill any holes in it for the antenna.

I am thinking about one of the Wilson magnetic mounts or maybe the thru glass mount from Solarcon.

Any idea which would be better?

Duane

     Hello & Good afternoon,
Go with the Wilson mag mounts, the through the glass
types are as worthless as RFENFORCER & Hooligan is,
absolutely useless. But all useless things aside, the
through the glass antennas are only good for about
one to two miles. The Wilson mag mount will give
you far superior performance.

I am fairly new to CB and I have many questions about CBs in general,
the answers to which are probably already on some FAQ site or site about
CBs in general. Is there a site that could tell me the basics about
CBs, SWR, best type, position of antennas, what kind of coax is used,
cheap mailorder places to buy basic equiptment from, etc.

So please, if you have some sites that you like, about CB's or companies
that sell basic cheap CB equiptment like plugs and antennas, etc.,
please respond. Thanks so much!

Looking for the modulation limiter hey? I would cut R-131 instead.
Does the same thing as removing the transistor only it's allot easier
to put back in if you need to

I was just wondering if all the models of Texas Star Amps have a separate switch for SSB ?

Also when using SSB is there a Delay on the receive like the Palomar 225's have ? What I am trying to say is that on the 225's when on SSB there is a delay from when you unkey the mike until you can hear the person talking back to you. I always happen to miss the first sentence or so because of this delay.

I was wondering if the Texas Stars have the delay problem also or if the delay is caused by the auto SSB on the 225's.
Thanks Again,
Tinker

You will find you run into a few other problems when you remove TR24 other than just the difficulty factor of replacing it.
Can't give up all the tricks.

DOES ANYONE KNOW WHO MAKES THE SHORTEST MOBILE COILED ANTENNA THAT CAN TAKE THE WATTS FOR AT LEAST AN 8 PILL AMP???

I HAVE SEVERAL GUYS WHO NEED VERY SHORT COILED ANTENNAS FOR THE BRIDGES AND STUFF WHERE THEY LIVE.
CAN YOU PLEASE GIVE MEASUREMENTS AS WELL AND WATTAGE RATINGS!!!

THANKS,

TOLL,
IS THERE ANY ADVANTAGE OVER THE 2 ANTENNAS YOU MENTIONED BECAUSE OF THE
WAY THEY ARE CONSTRUCTED???
BESIDES NOISE???

I have had it for 1 month,no instruction manual,it will go from 26 to 32, I
scan the band ,every now and then and find people talking above 40 and below
1,Were can I find a freq list of all the channels I have,I would like to
know the channels to avoid and the channels people are using"what they are
for" over all I like my new radio,It will go to channels most people
arn't,most of them are people from other countries,Oh I live in the upstate
of SC so the fraq list needs to be from the area or close BY

Hi,
I have an EARLY (PRE-Uniden) Cobra 148GTL for sale. Peaked and tweaked, covers 26.785-28.045, with a 40KHz slider. I don't need the radio anymore.

$100 or best offer. Cash only, no trades please. Buyer to payer shipping, and insurance if he/she wants it. Respond direct via e-mail, not to the group, please.

Thanks,
Bob

hi bill. with all the mods you guys discuss here you would think that you new about the chipswitch. take a look at the other cpu available for the 2510. ive ran a few of them and found them to be fantastic performers with tons of more features than any 2950.

best regards, Tim 2-IR-082 Texas USA

Could anyone tell me or direct me to a resource on how to set up a remote phone patch for a CB radio (I am aware that this is illegal but talking about it isn't). Any help is appreciated.

Thanks,
Greg

Tinker,

Good questions.
>> I was just wondering what class works best with A.M. and SSB . Or if all of
>> them will work but some may sound better than others.
>> Sorry for too such of a broad question.
>> Tinker
Just my thoughts on SSB FWIW. I hope Bill won't disagree:-)

Bill, drop me an e-mail detailing some of this 'leading-edge' research, I'm genuinely interested.

How I read what works for me being primarily interested in the very best possible sounding SSB mobile signal.

Class AB bias is adjusted so that Icq equals approximately 0.5-2.5% of maximum specified collector current. This translates into 100-500mA per transistor (2879) or 200-1000mA per pair of devices. This mode yields acceptable linearity for SSB operation and higher efficiency (40-60%) than class-A. The Toshiba 2SC2879 data sheet specifies a minimum Icq of 100mA per transistor for class-AB operation. I have found that by increasing Icq to 500mA per transistor results in increased linearity and lower IMD and harmonics.

People on air have asked how my amp (homebrew 8-pill) sounds so good as compared to factory ham band amp's, Metron, Henry, SGC, Ten Tec Hercules etc. The higher Icq is the reason.

You may ask why the factories don't increase Icq. Because it costs more dollars to build a separate high current bias source for each pair of transistors and even more to produce an amp that will remain stable with a high Icq. So the factories use the minimum recommended Icq because it is cheaper and it yields satisfactory results.

Since I've never been satisfied with satisfactory performance my unit has independent bias adjustment per pair of devices.

Class-B bias is adjusted so that Icq is just equal to the leakage current (Iceo). the transistor is just barely cut off and any drive signal causes the collector current to flow. This mode yields acceptable linearity for some AM applications and higher efficiency (60-70%) than class-AB.

The Skywalker amp kits are probably not what you're after as they are designed for 1.8-30MHz operation and are therefor not really optimised for 11m.

Phil / UK

Bill Eitner:

As to your post relative to the Sweet 16: What would be the best driver to use for the 16? Is it possible to drive the Swt16 with two pills? Are you saying that the driver should be set to the same wattage as the radio to see optimum results? What wattage should that be? thanks. I've been reading your posts (as well as posts in the newsgroup from Toll Free) over the last month or so and have to commend you both. You both shed a lot of light on subjects of interest to me. If you're ever in NY, let me know, I'll buy you a beer.

Please keep me in your prayers, I am getting off of these newsgroups & some parts of the internet. (Except news/Weather/Trains) I have mild cerebral palsy & therefor most things that are disability related are of no use for me. So rather then get in to problems I am leaving. I would like to apologize to all of the news groups & there sysop's or who ever is in charge. I seemed to get cussed out on the following groups;

alt.config
rec.radio.cb

I already got off some of them & most of the msn newsgroups have closed & they made them in to web communities. I am sorry but I rather get out because it seems that some people are calling me by voice & then not saying anything. So you all have a great rest of the year & happy 2000! BTW I am also sorry for uploading the sound files & using HTML on the news groups.

Thanks for all the information that I got on these news groups.

Hi folks,

My daughter and her friend ran away yesterday after school from Prince Edward Island Canada. They managed to travel hundreds of miles away from home overnight by hitching a ride with a trucker. At this moment they are somewhere in the Province of Quebec, with the trucker, headed west. They

phoned one of their friends at 5 am today so the
exact details are weak.
They should be spending the night at a truckstop
somewhere in Quebec. They have been reported to
the police nationwide but there's alot of highway
out there.
Can anyone give them a yell and tell them to phone
home? Their names are Alisha and Crystal.

Thanks all

Brian Wojtowicz
Prince Edward Island

Would you hear the static if it were outside the passband of the
receiver?

When you state "static" you mean noise generated by the engine, not
static electricty, right?

>Could anyone tell me or direct me to a resource on how to set up a remote phone patch for a CB radio (I am aware that this is illegal but talking about it isn't). Any help is appreciated.<

Pick up a copy of "CQ", "QST", or "73" magazine from the more well stocked newsstands. There are several patches available.

And without discussing the legal ramifications, I would have to ask "WHY"?!?

Forget INTENTIONAL jamming, just think of what the usual ambient background noise is...HOW can you effectively communicate with THAT cacauphony going on (unless you are only going to call another radio op who's used to it and can pick you out of the QRM)

Just wondering.

Steve

>above, mounted to a solid copper chassis.

>
>From their, you see CB radios.

The dx-100 has has a pair of 1625's tubes for the push- pull audio. I hear alot of am-only hams running the dx-100 on 3.882 +/- Mhz. I picked one up at a hamfest for 50 bucks! It's my loudest radio.(2). buddy tx-11b.(3).browning mk.1 with 6L6 replacing the 6BQ5 and a 2E26 replacing the 5763. (4.) Tram titan. (5.) Sonar fs-23. These are radios I have, and I'm preferential to tube sets. There are alot of solid state rigs that kick a-- too.

Phone Patches are not Illegal on CB Band as long as they are manually
controlled. You have to be at the controlling site to initiate the call
and to switch back and forth from the radio operator and the phone line.

Pick and choose what fixes are appropriate.
In my mind the single biggest problem is that RF
is getting into the input of the voltage regulator.
This causes output voltage fluctuations that in turn
shifts the VCO which causes the audible warble.
This can be remedied by replacing and increasing
the size of the input cap.It may also help to add
other filtering components at the input and output
of the voltage regulator. Here are the files. I will
paste them to the E-mail below the asterisk line.These files
were compiled. They are not of my authoring but they should
help.
****

Are there any techs out there that could/will post the modification
that will correct the problem that the 148F GTL has when you transmit
without the engine running- anything under 13.4V and the transmit on
SSB goes all to hell. I don't have a schematic on hand for this

Well, I thought I was the only one out here that had problems too.
Sorry to see you're in the same spot I was in earlier - I found my
problem to be with their [Cobras] upgrade to the 148F. The RF Choke
or T1, is the culprit - the voltage drop across the coil is too great
- about 1.5 to 2 volts under load. The MB3756 is a voltage

regulator/switch and requires at least 11.5 volts to regulate, and maximun of 16 - else it crowbars and can self destruct, [Believe me, I know] and the TA7222P audio chip - and everything else after it, is all handled through the RF Choke. [Up to and including Driver and Final - quite a bit of current crunchers on their own.] The original design bypassed the RF choke section and used a zener diode rated at 16-18Volts along with a electrolytic and disc cap to help filter ripple before going to the MB3756. In the newer models, the RF choke [T1] handles all the noise filtering and when put under a load, like the TX current draw, starts dropping voltage and the regulator can't regulate enough current and tops out on voice peaks during transmit, either on AM or SSB.

Also-----

The radio I have, with it's inherent faults, can be considered a lost cause. The newest problem I have found, and the purpose of the posted replies, is with the Voltage regulator itself. D44 was originally a 16-18Volt zener, now has a lower voltage rating - I believe around 15.2V in the newer ones. Many of todays cars produce around 14.4 volts to charge and run the ignition system. The MB3756 voltage reguator/switch will cut out due to a defective design, in both the component itself and the zener used on the newer models, while the engine is running [due to clamping at the diode] or distort when the engine is off [lack of voltage to regulate]. The MB3756 in these newer ones may be a defective chip, and if you have a radio that "Warbles" or "Pops" during modulation - observe the freq counter and TX/RX light - if strong, sudden vowel sounds and loud consonants type of modulation causes the TX/RX light to go green or yellow or drop frequency - suspect the regulator - it's close to crowbar'ng itself to keep regulation stable when the engine is running or dropping out when power supply voltage goes below threshold level. It's very sensitive to voltage swings.

In my situation, the load imposed was from a faulty capacitor [quite a few really] in both the input filtering, [1000uF 25V electrolytic was leaky] audio out to AM regulator [another electrolytic shorted] and due to transients, affected the MB8719 constant 8.2 volts, [three tantalums - one rated 10 volts quit during first power up on the bench.] All total sum left me with little left componentwise in the stockpile, and a piece of junk...

Also------

It is a low voltage drop out problem due to some component changes made when Cobra started using Malasian manufacturing plants.Don't even listen to all these hoky opinions of what is causing the problem-especially the dork that says it is a VCO problem. All it takes is a jumper a cut trace 1 diode and 1 capacitor and the problem is gone.

Hope this helps.

Well, lately, I've been getting a lot of mail from others regarding the 148 GTL-F model from Cobra - and this is the one that is made in Malayasia.

One of the Emails I've sent - even though this may cover more than what you want to deal with at this time - is added to this message. Please, keep this as an archive for your reference and general idea - let alone your
own good. This is a lengthy message - and is a generic response - but it covers a lot of bases you'd need to cover ground with while troubleshooting this chassis...there is a brief explanation - along with some other advice that pertains to audio problems arising from this poorly thought out chassis design.

There may be more than one type of problem - or worse, a problem that can arise later from a failure on another part of the circuit board that you may need
to fix later...the text attached - has some other key components you can offer as a list to your tech - so they can verify these parts are working like they should. PLEASE CHECK TO SEE IF THE PLL MB8719 HAS THE RCI LOGO, STAMPED ON THE CHIP - IF THIS IS THE CASE - THIS MESSAGE APPLIES TO YOU...

Reply enclosed...here is the lastest revision of my notes on this...

Date: Thursday, January 29, 1998 2:31 AM
Subject: Re: Cobra 148f warble

[...my stuff snipped...]
Yeah, it's the malaysian chassis... it has the RCI-8719-A chip which I heard is a better one than the original RCI 8719. I do, however, have an MB8719 chip (from a 1981-built 2000) sitting in the parts bin.

[Well, we might need that, after this is all over...it is the LAST resort...]

Ok, to bring you up to speed on this...

When Cobra changed from Uniden to Malaysia - they also decided to make some changes to the chassis - notably - condensing the noise from electrical power supplied - through the RF choke - for ALL of the radios power supply needs.

This poses a problem - due to excessive current draw, and the likelyhood of RF contamination in areas you don't want RF to be in - and this includes the VFO/BFO sections.

The Warble can be from excessive current draw from RF choke T1.This choke of the earlier Grant and Cobras served to filter ignition and other noises from the Audio Amplifier and Modulator circuits [The TA7222P & TR41-42 modulators.] With the rest of the RF prone areas going through the MB3756 voltage regulator/switch combination for RX/TX and PLL constant 8V regulation.

The warble is due to poor regulation from the MB3756 - it is losing power from the current draw at the filter choke - this can be fixed by splitting the power feed to the original form - and requires you to remove one trace, and install a jumper...to reduce the current demand at T1 to power everything. The MB3756 has good ripple rejection - but is flakey when voltage surges and current drops are beyond the "operating window" of 11 Volt minimum - there are 3 progammable outputs - one is left on to supply 8 volts constant that the PLL uses - with two other outputs being the TX/RX voltages.

[I would go with this first - to see if it clears up the warble - it might..just don't run the radio "flat out" if you can avoid it - for the warble is also current dependent and that means leaving in the limiter to provide some "cushion" to protect the PLL regulator portion from drawing more power than the regulator can provide.]

Install Jumper [ferrite bead of #16AWG wire would be nice - but not necessary] at J44 - by the MB3756 chip - inside chassis wall on right-side, middle - front facing you with component side up...You can also install a 0.047uF disc ceramic by this area, some boards did not come with this - mainly mine [C136]. A spot for an Electrolytic or Polarized capacitor is also located here - you may want to use a 100uF Electrolytic or 47 uF tantalum here to provide some filtering for the Regulator.

[Due to labeling - Verify that J44 does connect to the Pin 2 of the MB3756 chip.]

Also, check and verify that there is a diode in location D44 - you should have a diode similar to a 1N4148 - because of board revisions, and possible "dropped" components during soldering by machine - this component should be checked to see if it's working, and not blown open - if it has - RF contamination past the RF choke T1 can occur and problems with stability - or blown fuses - are going to happen.

D44 can be replaced with a 1N4148 with a 100PIV and a 200-300mA reverse surge rating - the diode from Cobra, in this area, is marginal in performance. Considering the cost of this component - it's a good idea to replace it now - before you find problems with it later.

The power supply feed to the RF choke that also "splits" to the MB3756 chip - is by Pin 2 on the IC4 [MB3756] - if you follow the trace side, the trace "dips" - towards the chassis wall as you follow it towards the rear of the chassis - cut clean here - to break the secondary feed from the RF choke.

[The earlier mods that I've done with this radio - have now been refined][You should check D44 - and use ferrite beaded lead on J44 for best][results...this helps keep RF from affecting the MB3756 ...]

This completes the conversion of the feed to the original form -split only by the power switch feed and the regulator is no longer forced to accept current swings from T1 [RF choke] as it attempts to draw current through itself and feed the Audio section and PLL regulation - they are now separate...

You may also want to check on the condition of the Electrolytics in the TA7222P area - mainly C175 and C176 - both are rated at 10 volts - you can increase to 16 volts to provide more headroom with less chance of failure. C175 is a 470uF while C176 is simply a 47uF electrolytic. And C172 should be rated 1000uF
at 28 volts. It is a good idea to check these components - mine went south after the first week of use. Another one to check in the VFO area, is C81 and C80 - both are tantalums 2.2uF/25V, and C84 - on bottom side 1000uF/10volts - all are suspect due to the warble affecting leakage around these components in a frequency sensitive area [the Balanced modulator AN612, has C95 and is rated at 10 volts 47uF - it may need replacement because of voltage swings from the "warble" being a voltage sensitive area and feed from the MB3756].

Well, did I scare you away yet - this stuff is a lot of work for one night - care for more? OK - you asked...;-) [Remember - Malaysian components were cheap and lacked quality...]

By the MB8719 - the ORIGNAL used a ferrite bead jumper known as L9 by Pin 9 of the MB8719 [we're at the PLL now...] on the 148F chassis - it's now a resistor of approx 10 ohms at 1/4 watt - I know it's silly but they did it, not me. This resistor acted as a current limiter for the [now] 5 volt tolerant PLL [RCI-8719].

Since you have the "A" PLL version, try using a lower value resistor here [L9] to 5 ohms - but use a 1/2 watt - sure it's bigger - but you do have room. This will provide current headroom without droppng voltage heavily [this is why the C89 cap was such a large value to compensate the current draw and keep voltages stable].

What I've done - and works, is to use a 1N4148 diode here - with banded end towards Pin 9 - this acts as a wattless dropper and provides the PLL with plenty of current [100PIV 200mA surge minimum] and keeps the board from "pulling" current away from the PLL during "peak" modulation times. HOWEVER, the MB8719 in mine only worked with a 5 ohm resistor and diode placed piggyback [up/down] on the board [banded side to the board on the pin 9 hole feed - with the anode tied to the resistor - with it's freed end towards the other
hole].

The clarifier mod is like the Grant/148 of older chassis - WITH ONE EXCEPTION - you use R44 in line with the voltage [8V+ to clarifier] feed to the constant 8Volt supply - this reduces current/voltage to safe levels and provides the proper drop to operate the radio within the RCI VFO recommended ranges. So, that means - remove R44 from the board, and use it in-line [soldered in parallel] with the power feed to the 8 volt constant - this may reduce slide - but keeps the MB8719 within operating range.

Ammendum
UHIC 007 [IC2] can also cause problems - since you've already replaced this component - and still have "warble" problems - the most suspected parts are the L9 region - explained above - or the T1 feed needs to be broken at IC4 [MB3756]

WARNING!
Due to numerous problems with this piece of SH*T [BCD failure -switch spiked PLL/BCD channel switch was poor quality - IC2, UHIC007 - bad, numerous bad capacitors and poor soldering joints [please check your circuit leads for solder beads and use a Geiger counter - mine was radioactive - moreso than typical background
radiation - which I found quite suprizing - the Grant that I still have is/was silent] - I've simply given up past this point - and I'll also let you know - that I no longer have this radio in my possession - it was simply a "refurb" that got past quality control - whatever that means nowadays - and is either floating down a
sewer - or is being used as a boatanchor - in it's true meaning in life...

The above was from my notes of an era long past - I hope these notes can still apply to your situation - good luck!

The HB-23 was a mobile rig. The older tube base rigs that I remember
were the "HE-20" series. They had typically, a selectable crystal
transmit (less than 23 channels) with a tuneable 23 channel receiver.

Jamming a repeater?

Look, I know you probably don't give a hill of beans for what I think
here, but FWIW, anyone who deliberately jams anothers' radio hobby is
the lowest of the low. There is no justifiable reason for it. If there
are people on ANY radio frequency that you cannot stand, then you either
move, do your best to ignore them, or you find a convienient time to
discuss their personality differences off the air. If you find that you
just don't "mesh" with the personalities of hams, then stick with CB.
I'm sure that if the shoe were on the other foot, that you wouldn't be
too happy if someone jammed all of your QSO's, simply because they

didn't like your voice, or for any other reason.

We all hear our share of assholes on whatever band that we choose to run on, but if everyone decided to key up on everyone that they didn't like, there'd be nothing but hetrodyne on every frequency. I know of a few hams in my area, that I personally don't care for. One of them is a mental case, and suffers from extreme paranoia. His QSO's mainly consist of the who's-who list of people that are trying to "get" him, and the things that he's done to "prevent" it. One of our local guys felt sorry for this guy (he's far too nice), and we had to listen to this wacko drone on every night. We solved the problem by basically driving him away, by ribbing and heckling the heck out of him. He couldn't take it so he left. If we had instead resorted to simple jamming of the guy, he'd just add it to the list of things he was crusading against, and continued to drone on to whoever was lucky enough to be in QSO with him.

We all have had out share of discussions of "rules vs. no rules". Personally, I don't care if someone runs illegal power, extra channels or whatever. But you have to be able to respect other people's right to enjoy their hobby as well. I'd much rather deal with people running 1 KW on CB, but with courtesy and respect, than a 4 watt station that swears, jams, and carries on all the time. One is breaking a technical rule, the other is breaking not only an FCC rule, but is also breaking the rules of proper social behavior.

For what it's worth.

I have always liked the performance and tonal quality of this mic, but have always hated the extra weight and hassle of the 9V battery inside. Well, that has been rectified. I have developed a way of running the

D104-M6B hand mic without the battery! My method involves using a DC
source within the set to power the amplifier inside the mic. It doesn't
require any additional wires(from set to mic) or any rewiring of the
micropone cord. However, it does require two components and minor mods
inside the set and the mic. Any interest?

Professor

How does the RF choke (for the DC ground) know which component to drain off? The choke is essentially open at 27 Mhz. The engine noise that the receiver would pick up would be a 27 Mhz signal, just as the desired signal would be. I can see where the choke would drain of the static electricity buildup on the antenna, but not an RF component

Wilson also sells a whip called the short load which is a center
loaded short whip that works with the 500, 1000, etc bases.

Go to www.wilsonantenna.com and look at their products page.  Go to
the botom of the page and you'll see the "short load" whip which will
work with any of the Wilson mag mount or hard mount bases.  I don't
think its meant to be used with a little Wil' though.

Hi Holly,
Well thats a good question, it depends on what you are trying to do . If you are trying to talk ground wave and want max distance then a antenna like a 102 steel wipe will do a good job. If you want an antenna that will take power and is not as long a WILSON 5000 will work fine or if you want a good antenna that has good signal to noise racial and you can hear at freeway speeds a K40 is a good choice. If you talk a lot of SSB and want range a Town & Country will do a great job. It depends what is important to you (your needs)

> This completes the conversion of the feed to the original form -split only by the power switch feed and the regulator is no longer forced to accept current swings from T1 [RF choke] as it attempts to draw current through itself and feed the Audio section and PLL regulation - they are now separate...
>
> You may also want to check on the condition of the Electrolytics in the TA7222P area - mainly C175 and C176 - both are rated at 10 volts - you can increase to 16 volts to provide more headroom with less chance of failure. C175 is a 470uF while C176 is simply a 47uF electrolytic. And C172 should be rated 1000uF
> at 28 volts. It is a good idea to check these components - mine went south after the first week of use. Another one to check in the VFO area, is C81 and C80 - both are tantalums 2.2uF/25V, and C84 - on bottom side 1000uF/10volts - all are suspect due to the warble affecting leakage around these components in a frequency sensitive area [the Balanced modulator AN612, has C95 and is rated at 10 volts 47uF - it may need replacement because of voltage swings from the "warble" being a voltage sensitive area and feed from the MB3756].
>
> Well, did I scare you away yet - this stuff is a lot of work for one night - care for more? OK - you asked...;-) [Remember - Malaysian components were cheap and lacked quality...]
>
> By the MB8719 - the ORIGNAL used a ferrite bead jumper known as L9 by Pin 9 of the MB8719 [we're at the PLL now...] on the 148F chassis - it's now a resistor of approx 10 ohms at 1/4 watt - I know it's silly but they did it, not me. This resistor acted as a current limiter for the [now] 5 volt tolerant PLL [RCI-8719].
>
> Since you have the "A" PLL version, try using a lower value resistor here [L9] to 5 ohms - but use a 1/2 watt - sure it's bigger - but you do have room. This will provide current headroom without droppng voltage heavily [this is why the C89 cap was such a large value to compensate the current draw and keep voltages stable].
>

The warble is coming from the fact that the radio was modified
incorrectly. The DC source for the varactor diode is unstable...

I'm afraid you won't find many mods for this radio... mostly because
the schematic is very hard to come by. I have never seen one. For that
matter, I challenge you to give me the address of the manufacturer of
this rig. I don't think you'll find it anywhere on the set, the box, or
any documentation that came with that radio. Maybe they're trying to
tell you something. Sorry, don't have any need for a product like
that...

Make the coax long enough to go from the radio to the antenna mount.
Check the match. If the match is below 1.5:1 you are done. If not...
you can make slight variations in the match by adding small sections (2
to 3 feet) of coax to the line. Every installation is different and
there is not an exact length that can be given to you.

Mike,
More wattage is not a product of a swing kit. However, amplitude
swinging does have its benefits. While it reduces the carrier... it
raises the percentage of modulation applied to the signal. This
technique is extremely valuable when using the set to drive an externel
amplifier. It allows tremendous audio levels while ensuring that the
amplifier will not be over-driven.

Great, that'll teach me never to use our Royal Mail again.
>The Commander, Pride (Solid State) and Palomar 250 and 300A (Solid State)
>all had adjustable bias for each pair of devices.
Very few of these ever made it to our shores. Correct me if I'm wrong
but most all of these models go back to the 70's & 80's? Prior to
legalisation of CB here in the UK in 81 very few people imported stuff
from the US. It was mostly Euro junk as now.

I personally brought in Varmints and some Grays. On my travels around
the US back then including visiting a few CB jamborees. I had problems
tracking down sources of amp's. I managed to track down Messenger in WA,
Hurricane, Storm & Tornado in NY and if my memory serves me right Texas
Stars in NC. Other than the Messengers I never was sure if I'd found the
actual source.

Anyhow I'm into other kinds of amp's these days. Kind of gone up a step
or two if you know what I mean.
>You could really make one of those amps sing, if you knew what you where
>doing. I had many truckers sold on my work just after selling them one of
>those amps and tuning it (both the radio to the amp, and the bias to the

>
>
>Your right. The higher Iq does make a difference on sideband.
>
>Now, if you would only finish that 3CX3000 mobile! we would be able to hear
>you stateside!
I've left the 3CX3000A7 with my friend John. It's in a Henry plasma
generator rack c/w 3-phase PSU.

My mobile will have to wait. Some auto dealer in MO has screwed me on my
Suburban which I'll probably now never see! That'll teach me to trust
auto dealers.

I'll consider buying another when I've put some more money by.

My present mobile is limited by space for extra alternators. A single
200A is all that's possible and this has therefor limited me to running
my 8-pill.

Remember, I also have the 3CX2500 which I may put together but a
suitable vehicle really must come first. I have no experience with
generating AC power in a mobile though I consider I have DC power
generation down to a fine art. I go about it differently than most all
you guys and have no problem holding voltage on key down.

If the two antennas overall length are comparable... then their performance should be comparable also.

However, there is something that bothers me a bit. You say you are using the antenna that has less engine noise. This may not be the best choice. The reduction in noise may mean that that antenna has a lower gain than the one that picks up more noise! What really should be done is to attempt to eliminate the source of the engine noise and reduce it...

For $20 you could just throw it away if it doesn't perform very well. Heck you are going to have to put $5 iworth of batteries in it just to make it go. How much cheaper do you want to go?

Well there is a noticeable difference between A & B when you listen to
it on air.
>

OK, I hear where you're coming from.
>
>> The Skywalker amp kits are probably not what you're after as they are
>> designed for 1.8-30MHz operation and are therefor not really optimised
>> for 11m.
>
> 27 MHz is in the 1.8 to 30 MHz range--isn't it?

Well yes, but, in Lee's Skywalker output transformer design he mentions
using type 43 material as against the maybe more popular type 61. The 61

material has a lower initial permeability (125), higher resistively
(10p8), and higher curie temp (350c) compared to type 43 material which
has values of 850, 10p5 and 130c respectively. The type 61 has a higher
resistively than the type 43 which leads to higher efficiency especially
on the higher freq's. He says he decided to go with the 43 due to the
lower initial permeability of the type 61 material yielding a 1" long
transformer with an Xl of only 11 at 1.8MHz which does not meet the
requirement. A 1.5" long type 61 transformer has a Xl of 17 which does
meet the requirement but the longer transformer has a much higher
leakage L which hurts performance on the higher freq's. He decided, just
as Helge did years ago that the best performing design over 1.8-30MHz
results when the type 43 is used in a 1" long package.
He is waiting for someone to design a new ferrite material with high
permeability and high resistively but is not holding his breath as
materials have not changed much in years.
>   You're not an idiot.
Yes, this is what my favourite school teacher used to tell me.
> Bias your amp just to the point where
>   there's no audible distortion on SSB. THAT is Class B bias
>   and one leading edge facet of amplifier development. Store
>   this one comment as a research based golden nugget.
I will go and play in the next week or two.

Thank you.

Professor, I am surprised at you!

(Skorzy):>> I've noticed that the Wilson doesn't pick up as much of the engine noise through the antenna as the Penetrator does, which allows me to keep the squelch at a lower setting<<

(Prof):>If the two antennas overall length are comparable... then their performance should be comparable also.<

(Prof again):>However, there is something that bothers me a bit. You say you are using the antenna that has less engine noise. This may not be the best choice. The reduction in noise may mean that that antenna has a lower gain than the one that picks up more noise!<

Come on!...Do you really believe this???

(1) Relative size of antennas does NOT always mean that you can expect the same degree of gain and/or performance! Other factors such as materials used in constuction, feedline, location of mounting, method of feed (direct coax, shunt feed, etc), base, mid-shaft or top loading, type of coax & quatlity, etc. ALL variables that may affect performance!

(2) The "Penetrator" antennas have that hu-mong-ous "loading coil" that only INVITES road, engine and enviromental noise!

Anytime you expose that much of an inductor to an already noisy enviroment you are asking for even more problems. Simply moving that much surface area through free air generates static which, to an AM radio, is just more noise! More noise is NOT more gain...it's just more noise!

Example? Most of the HF antennas used by the Amateur HF mobile community are either helically-wound whips, or have the inductor inside some sort of enclosure to minimize air and other contaminates on the coil. This is not just done to extend the longevity of the antenna, it reduces noise.

Yes, there are exceptions...some antennas have loading coils that are just too big for any kind of practical enclosure on a mobile. But unless you are running HUGE amounts of power thru them, there's no need for those massive inductors.

The "Penetrator" line of antennas appeals mostly to the "Mine Is Bigger Than Yours" mindset, and has very little to do with antenna efficiency.

```

While I agree with your statement... that antenna length doesn't always
mean the same degree of performance... it does in this instance. In
this case... bigger(longer) IS better. The closer you get to the
practical mobile limit of 1/4 wavelength, the better the performance
and the closer you get to a unity gain station! The fact is... loaded
antennas are inferior to a full length whip!!!!

P.S. Bigger coil antennas don't "invite" more engine noise! You make it sound like a noise magnet. That statement has absolutely no validity and is ridiculous.

Hey ICE these antennas are made in a variety of lengths the shortest being somewhere around 20" plus stinger, as far as weight that is one thing I can say for sure, They are super light. I run them and prefer them, not just because they seem to work well, but because I dont like poor looking equipment and these antennas are machined from one end to the other and every machined seam hides completely when you screw them together, they look like some thing you would see on an aircraft, as far as the machine work goes. I have been running these antennas for five years without any difficulties.

The real thanks should go to Andy at codyspc@iserv.net
All i did was research Deja-News for answers to the 148
problem. I then just copied the info. His posts kept on popping
up in the search.

The 148's of recent years have had this problem on SSB.
Even the stock 148's have warbled on SSB straight out
of the box.

What i don't know is if the present day 148's have had this
problem corrected. Cobra was made aware of it long ago.
If the chain of command was not broken, and if they are
the least bit responsible, the new 148's should be fine.
Maybe someone could affirm this?

All swing kits do is make meters swing, which seems to really thrill
cbers, nothing more.

Perhaps not entirely, but if a vendor knows that a piece of equipment is
generally of crap quality or performance, why sell it? Or if you do, add
a note indicating that it isn't recommended. I know that these guys
aren't Nordstrom's, but gee wiz, if they are going to sell a piece of
crap, they OUGHT to expect it to be coming back with some regularity.
Perhaps their profit margin is in the shipping charges, and they don't
care if it is returned repeatedly??

> 2510.

Then you've never really compared it to a high-level AM
radio on a scope. The difference is plain as day. It
would be even more plain if you could look at it using
the trapezoidal method. The drawback is you need a decent
audio signal to do it that way. Low level AM doesn't lend
itself to that method.

> The radio's amplifier is capable of producing between 40 and 50
> watts peak power on SSB (after tuneup), and would produce the same
> carrier level, if the carrier were set to full on.

That doesn't mean a thing. It's the ability to fully modulate the carrier is what we're talking about. There may be enough audio to fully modulate the carrier way back at the TX mixer, but when put through a bunch of linear amp stages the positive modulation percentage noticeably decreases. Think about it. If that wasn't the case, why would anybody use the more expensive high-level technique?

> With this in mind,
> peak AM modulation should also fall in the 40 to 50 watt range, which
> should allow 100% modulation of a 10 watt carrier.

That's absolutely untrue. There's no connection between SSB peak and AM peak in a low-level AM radio. For example, my Jackson peaks lower on AM than my 2950, but it peaks higher than my 2950 on SSB.

> My testing on my own
> 2510 seems to bear this out, as I have no problem getting 100% (4X) peak
> power with a 10 watt carrier.

Then you should check your test set-up. You may be seeing what you expect rather than what is really there. Remember to limit your test to 100% NEGATIVE modulation. In other words, set the carrier level, then inject a steady 1kHz tone and ramp it up just to the point of 100% NEGATIVE modulation. (I'm assuming you know how to do that.) At that point, measure the percentage of POSITIVE modulation. If the carrier is higher than 4 or 5 watts, the positive modulation will be below 100% even though the negative modulation is at 100%. That's the problem with low-level AM radios. It gets worse as you ramp up the carrier (dead-key) power.

> The modulation envelope is "normal" at
> this level.

No it's not. You're fooling yourself.

> Lower carrier levels of 4 or 5 watts, gives an even more
> peak power ratio if the limiter is not set to hold at 100%.

We're not talking about unlimited modulation. We're talking about ratios within the 100% boundary. Another easy check is to verify average power. Given what you've said, the 2510 should be able to hold an average wattage of just under 15. That couldn't be more false. Set the dead key wattage to 15 and then modulate the carrier while monitoring the average power using a Bird. The power reading will decrease with modulation no matter what. That indicates an average power that is less than the dead-key power.

> Generally speaking, most radios will lower total peak power, when
> carrier is dropped, unless a "swing" type mod is employed to bypass the
> AC modulation component (the capacitor) around the resistor that lowers
> the carrier level.

That all sounds nice, but let's stay on track here.

In every AM performance parameter we can think of, the
2950 will easily outperform the 2510. That's what this
is all about.

> >
> > On the other hand, the 2510 will show higher peak

It's not by "at least 10 watts." It's more like 5. On the
other hand, the 2950 beats the 2510 on AM by 5 peak watts and
more when maximum peak to carrier ratio is considered. Don't
get carried away.

First, Toll Free doesn't agree. I tend to believe Toll over you.
I've stared at 2510 schematics for hours trying to figure out bizarre
problems. I've never noticed the circuit you speak of either.
You're going to have to lay out some part numbers and circuit
analysis to convince me.

I do disagree with much of what you've written.

See below for details.

> Bill, drop me an e-mail detailing some of this 'leading-edge' research,
> I'm genuinely interested.

Forget the e-mail. I'm going to roast you here just like
you tried to roast me. Grab as much of the leading edge
stuff as you can.

> How I read what works for me being primarily interested in the very best
> possible sounding SSB mobile signal.

Forget what you've read. Test the leading edge research
rather than passing it off so quickly.

> Class AB bias is adjusted so that Icq equals approximately 0.5-2.5% of
> maximum specified collector current. This translates into 100-500mA per
> transistor (2879) or 200-1000mA per pair of devices. This mode yields
> acceptable linearity for SSB operation and higher efficiency (40-60%)
> than class-A. The Toshiba 2SC2879 data sheet specifies a minimum Icq of
> 100mA per transistor for class-AB operation. I have found that by
> increasing Icq to 500mA per transistor results in increased linearity
> and lower IMD and harmonics.

The trick is to forget test equipment based specs and go
by what your monitor (you have a monitor don't you) says.

> People on air have asked how my amp (homebrew 8-pill) sounds so good as
> compared to factory ham band amp's, Metron, Henry, SGC, Ten Tec Hercules
> etc. The higher Icq is the reason.

That's all useless anecdotal evidence. If you're going to
roast me, I'm going to call you a liar to your face. You
couldn't be more wrong by acknowledging quiescent collector
current as the reason why your system gets good reports.

> You may ask why the factories don't increase Icq. Because it costs more
> dollars to build a separate high current bias source for each pair of
> transistors and even more to produce an amp that will remain stable with

> a high Icq. So the factories use the minimum recommended Icq because it
> is cheaper and it yields satisfactory results.

It's more than that. The amps actually work better with less bias. Class B lives even though you don't recognize it, believe in it, or understand it.

> Since I've never been satisfied with satisfactory performance my unit
> has independent bias adjustment per pair of devices.

What the fuck does that mean? Re-read that with the understanding that you didn't write it. I hate to say it, but you lost it right here. Nobody cares about your amp when you're debating me. We're dealing with concepts here, not how your personal amp responds.

> Class-B bias is adjusted so that Icq is just equal to the leakage
> current (Iceo). the transistor is just barely cut off and any drive
> signal causes the collector current to flow. This mode yields acceptable
> linearity for some AM applications and higher efficiency (60-70%) than
> class-AB.

This type of operation IS the leading edge. Class B has all the benefits and no disadvantages. Forget your biases and go with it.

> The Skywalker amp kits are probably not what you're after as they are
> designed for 1.8-30MHz operation and are therefor not really optimised
> for 11m.

27 MHz is in the 1.8 to 30 MHz range--isn't it?

You're not an idiot. Bias your amp just to the point where there's no audible distortion on SSB. THAT is Class B bias and one leading edge facet of amplifier development. Store this one comment as a research based golden nugget.

Second time sending out. Don't know where it went...
       Date:
            Fri, 24 Sep 1999 17:03:30 -0700

I am looking for any other mod's on these radios. On the two Cobra's
there is the same PLL, the LC7185-8750... There is no mod for that chip,

but I am wondering if I could swap that one out with a different one?

On the HandHeld I am mainly looking for channel mod's...

The Euro, I have some-what peaked it, tho I am suppose to get 15 watts
am, and I am only getting about 8 watts.

I am looking for power mod's and channel mod's.

Any help would be greatly appreciated...

Thanks,

BlackCat

Oh no! Those are evil, vile, wretched, awful bad bad
men who use linear amplifiers! Shame on them! I bet
their mothers brought them up by allowing them to play
with linears since they were old enough to talk, first
a 50 watt, then a 225 for the big 10th birthday, then
the degenerate, criminal teenage years saw these people
playing with amps rated at 500w PEP or more!

I just want to cry knowing that these heinous, vicious, demonic people exist!

My idea, and the reason I know it be illegal, was to have an un-maned phone patch (sort of a poor man's cell phone) so I could radio a remote device that would pick up the phone and dial out to a number of my choosing.

An earlier poster questioned the clarity of this type of communication but some of the channels are so underutilized in my area that I wouldn't have to be too concerned about clarity.

Thanks,

Greg

Actually, if you put one end of the potato up your ass, and the other
end in a cup of water you'll get a full 12 volts out of the tip of
your penis!

Do not get the PC122XL or the GrantXL unless you want a SSB radio.
What is SSB you say? Check some of the websites on this.

```
>Will a Wilson Little Wil antenna work okay for these radios?   I am not a
>power user, and I can't see spending almost or as much for an antenna as
>the radio cost.

Unfortunately the antenna is as important as the radio.  So you should
expect good ones to cost more.  The Little Wil' will work for close
proximity and highway use but your not going to get to much out of it.
Its great point is that its only 36" long.

Try reducing the carrier to 2.5-3.5 and retune for output while speaking into
the radio. It will be louder and  be heard further down the road.

The level inside the car would vary with every vehicle and the location
of the antenna. It isn't really relevant however. The emmission is
presumably occurring in an uncontrolled environment, so the guy in the
next car, some feet away, is subject to rf exposure as well as any
passengers within the vehicle. If you somehow feel that it is possible
to lower the rf exposure within the vehicle to a safe level (by FCC
standards that is), I would love to see the numbers and how you arrived
at them. But until then, I will live with the FCC standards established
a few years ago, like them or not (my view is that they are excessively
tight, but then, I didn't conduct the study).

My Wilson 1000 SL is developing what looks to be some sort of rust colored coating on it. Is this normal? Should I put some sort of protection on it or something?

It is better to remain silent and thought a fool,
rather than speak and remove all doubt.
In your case it's too late. I guess you're too "stupied"
to know. Who pissed in your Wheaties this morning?

You sound like Mr. CB-King with an attitude! All your kicking and screaming,
just so you can get your blood pressure up. Maybe you'll pop sometime soon.

Ever figure that the more you cuss, the more we laugh at you. Folks don't
do anything different here than on the radio. Some folks know how the get
a good laugh at an idiot's expense. You're keeping me in stitches!

"MR.2SC2879" wrote:

> <<<<<<<<MR.2879>>>>>>>>

How is your supply of blood pressure medication? Many web sites now ship
medicine through the mail. You won't have to leave your computer to re-up.

You can send non-stop hate, racial slurs and general discontent all day.

:A>to have.

BZZT!

A licensed ham can have whatever radio they want. If you were a licensed
ham it would be perfectly legal to use this radio, as long as you used
it on the legal frequencies. Many ham rigs actually RX and TX from
.5 Mhz all the way through 30Mhz, without any interruption. It is legal
to own these rigs, as long as you don't use them illegally.

do they make short antennas??? I need them for the bridges here in NYC!!!
I prefer very light weight antennas.
What do these weigh???

Hi there,

I`ve been looking around for a good deal on a handheld (or hand held) CB radio. I can get the GE 3-5980 at around $20.00. Does anyone have anything positive or negative to say about this radio? I`d like to hear it VIA E-MAIL. Or if you have a handheld unit for sale please e-mail me.

Hello All

Here is One for You to kick around.
```

```
I have a Cobra 148GTLDX, the old Model. After having a Freq. Counter
hooked up and in the shop twice
to have this Warble Fixed, I am told that it is still there.
My Question is what causes it and how to get rid of it ? The Radio seems
to be Driving My TS DX400 well.
On SSB it swings to the end of  the 500w Scale and needs more Meter.
Anyway................

This Warble is Driving Me Crazy, Please Help !!
TIA

Mike

Hi

A friend has just given me a pair of fairly old but working US frequency walkie-talkies

They are Realistic Model TRC-200

They are fitted with replaceable transmit & receive crystals.

My question is: can I fit crystals to get these working within the UK permitted CB wavebands and if so, what crystals ?

Many Thanks, please suggest other newsgroups if you think this one is inappropriate

     Jamming isn't all there is to it just like having the
     highest output amp in a particular class isn't all
     there is to a competition.

hope the car don't flip when the motor locks up.
YEARS AGO i had a NEW 1987 YUGO, (stop laughing), with a 2510 a 1/4 wave whip
and a magnum 2000amp, (125-am / 200-ssb), in between with a stock 55 amp alt
and a 700 amp sears die-hard.
when i keyed up, you could hear that size 12 shoe box lug down real bad.
good luck
jeff

Alright I own a Galaxy 77hml and I have a Palomar 225 with a 6 ft
fiberglass whip
i know the Palomar isn't the greatest but i got it cheap so i bought it
now i have a couple question's because i'm having some problem's with
it. First because of the Galaxy being a 10 meter radio does this affect
the amp? Second of all should I be using some kind of antenna other then
your basic whip? and now my problem's god you guy's are gonna hate me
cause i'm kinda stupid when it come's to this cb stuff but i learn as i
go on
alright i'm running that like i told you and the Galaxy 77hml has a hi
med low setting and i use the lo for the amp which has been tuned to
like 5 watt's i believe and i use the high for when i'm talkin
barefoot. Well the other day i keyed up on hi power on the radio and
the amp was running and instead of the amp blowin or anything the hi
power on the radio is messed up in crackles now so i have to use med
power when running barefoot. I think this might be because of a bad
match i'm not sure though and if you guy's could help me out i would
aprectiate it greatly thank you

i fully agree with this one.
just explain it to the RF police, (present company excluded, they know who they are). they seem to think that a license gives them a badge and authority to police bands that don't fall into ANY ham license class and, there for, doesn't even concern them.

jeff

I'm not so sure the coax in a glass jar is a complete hoax. A couple of weeks ago I was at a neighbors house when a thunderstorm came thru. We were on his front porch and I saw lightning hit my tower. I had my coax in a glass jar and that is the only reason I can think of why my radio equip wasn't toasted. If you think about it it's kinda logical. Lightning will normally take the shortest path to ground. If the coax is attached to the radio then there is a path to ground thru antenna to coax to radio then out thru the power cord. If the coax is in a glass jar there is no path to ground thru the coax reducing the likelyhood of lightning coming in thru the coax cable. Instead, assuming the tower is well grounded, the lightning will tend to run down the tower instead.

I run a base loaded Wilson 5000 and blows away anything that I have tried to date. K40(had it for 2 weeks and got rid of it(junk) and JC Whitney(why would you waste your money on them) are the ones that need to be in the trash. I talk 15-20 miles on a routine basis and that is with the power turned down to 2 watts.

Tuning L38 doesn't really do much for PEP on my Grant XL. While it does increase deadkey about a watt, the max swing barely increases. I'm wondering if my tuning procedure is off. I've removed R131 and TR24 and adjusted VR10 for about 5 watts deadkey (though it can go up to 8). Currently swings to about 16. After tinkering with L38, it can go to 6 watts deadkey (9 max) and swings to about 17, though I re-adjusted VR10 back down to 5...

>SNIP.....) >if you were using a cobra 148 modified for strictly 10 meters and
>had a texas star 350 behind it, you might get your equipment confiscated by
>some un-trained law man who doesn't know how to tell the difference.<
>
>   I think you had that the other way around,

frist, i wrote it the way that i meant it. i was actually looking out for the
ham's right to use home brew equipment.
i actually, in principle, invite this law myself because if there's enough
screw-ups by local cops, it'll get tossed and if the law runs flawlessly,
believe it or not, i'm for that too.
it's the 1/2 assed way that things are done now that breed contempt for RF
rules and for those who THINK that they are badged to police it here.

> First of all, let's get one thing clear...ANYONE who intentionally
>operates ANY radio transmitter so as to create interference, wether it's to
>yor
>neighbors stereo, or (God forbid!) NAVAIDS is a criminal, no matter what.

>I don't care WHAT license (or authorization, in the case of CB) they have.
>
>

we do agree here.

>The difference to date, however, has been the Amateur Radio communities
>overwhelming desire to have this mess cleaned up...within our ranks as well
>as
>outside of them.

as quietly as posible as to not ruffle the feathers of the 100% outlaws. hams
are only 10% outlaw so that doesn warrant mentioning when the RF police are out
there keeping the world safe from us " pill users".

>even at some self-humiliation,

this must be a new term in the 2000 ARRL handbook. i didn't see it anywhere in my 1999 edition. hmmmm.
>Unfortunately the same self-policing ideal has not set up in the
>Citizen's
>Band service.

you pick up on things really well. please explain this principle to the RF sheriff and his deputys.

>   I too am a CBer. I have as much right and entitlement to those airwaves
>as you or anyother citizen. And I have a reasonable right to expect that my
>"rights", such that they are, will be protected there too.

i agree 110% here too. if your rights are being violated on the cb band, do what we do. GET A BIGGER AMP! this is the only protection that we get, short of vigalanti-ism.

> As for the Ham who was looking to put his rig on the FRS freq's, all I can
>say is there's a loon on every lake. I personally would rather find a way to
>put some of those nifty rigs on 440MHz rather than put my 440MHz rig on FRS.
>One of the Rat Shack rigs is really a well engineered piece of gear, and for
>less than $100 bucks, would make a nice low-cost alternative to YaKenComCo
>rigs
>out there now.
>
>

once again, i agree 110% but everytime we want to put one of those "nifty" 2510's, 2950's, galaxy's, etc..., on 11 meters, hams start shittin' red bricks,(tan sand ones here in fla.), and most of us don't even go into the ham bands with them.

>
>>there's dirt on both sides of the fence but the RF police hams are always
>pointing at our pile while ignoring the heap behind them.<
>
>   Sorry, only partially true, and I imagine a manifestation of some
>paranoia
>on your part. Hams have been very aggressive in keeping our own stalls as
>clean as possible. The current enforcement actions are the net result of
>that.

the fact that it's only partly true is the problem. untill you compleatly clean your yard, don't bitch about mine because your side of the fence smells as bad as mine.
paranoia on my part???
try this experiment for 1 month and let me know the results.
change your screen name and id'er and start asking questions about radio mods and amps and look at the id's of the RF police who jump down your throat. be very general and don't let on that you are a ham.
don't use the term cb, use 11 meters. some of the RF police will help you, assuming that you mean cb, when you could be refering to the out-bands. other

times the RF police will fire on you as soon as they see your hat, not knowing
if you are a ham asking for a LEGAL 10 meter mod or if you are someone in
another country where these freqs ARE legal.
not all countries belong to the ITU but the RF police are so self-centered as
to believe that this is their own little U S A only web board and can run off
anyone that they believe is breaking the law when the have no authority to do
so in the first place.

>If the really serious 11 meter ops were to make a
>concerted effort to clean this trash up, and quit flaunting the law with
>megawatt keydowns and blatant violation of other regulations, thre wouldn't
>BE
>any effort to pass this torch on to local law enforcement, but that's not the
>reality of the situation.
>
>

this the point that i've been trying to make for 6 months now.
WE KNOW THAT WE DON'T HAVE THE AUTHORITY, MORAL OR ORHERWISE, TO CONTROL OTHER
PEOPLES ACTIVITIES!!! WE ARE NOT THAT ARROGANT. IF THE GUY IS HOLDING A GUN
INSTEAD OF A MIC, THE STORY CHANGES.
IF THEY WANT TO OPERATE THAT WAY AND GET CAUGHT, SO BE IT. I WILL STEP BACK AND
WATCH AND KEEP MY MOUTH SHUT.
i hope that i've made my "one thing" position clear.

>of
>them.

the big deal about putting the hams down, specifically the RF police, is the
fact that they could devote more of THEIR energy on THEIR side of the fence.
i mostly keep my opinions about the channel masters and their keydowns to
myself. i agree in principle with the idea of experimentation but not with the
practice of driving something akin to a carnival generator truck for daily dx
comms.
i thought i was in the majority or at least the average group who takes pride
in running a clean radio at only 200 or 300 watts mostly on the out-bands and
only with the power that i need to sustain comms. gee, that almost sounds like
the ham credo, doesn't it? i guess mine is kinda like a common-law radio
system, i'm not bound by a piece of paper but the radio still puts out. (i had
it's tubes tied.) :):):)
i have to give the big radios credit for one thing,
other senerios have been posted with a bunch of what if's and maybe's so here's
mine:
WHAT IF the local arc hq and repeater sites in a very rural community were
destroyed by a storm along with all the other ham towers, cell towers, phone
wires / microwave installations, cb antennas, power lines, ect...
now all these boys bring out those big portable broadcast stations that they
keep in hiding and set up a comm link to the outside world in order to save
life and limb of the community.
under fcc rules, there are NO illegal freqs or equipment when it comes to
endangered life or property EMERGENCYS.
i would bet the hams would be more than happy to use this equip. if it meant
saving their skins and they could probably be able to rebuild their club house
when they shit all of their collective bricks when the fcc doesn't penalize the
opps that were running 50 kw on the out-bands or cb.
NOW, I KNOW THIS IS AN OUTRAGIOUS EXAMPLE BUT, you can't say none of this CAN'T
happen. there is a better chance of this happening than some of the nuclear
examples that i've see here. i agree with the nuke thing but politically
speaking, the weather carries more hazzard on a larger scale than the nuke
threat on a day to day basis.
oh welllllllllll

>If you read the ham NG and/or QST, you will find that the fellow in question
>was condemned across the board by the Amateur community.
>

i'm sure this is true and agree with you but the key words here are as follows:
>If you read the ham NG and/or QST,

it was posted here once and there was no outcry for a lynching on THIS ng by
any hams like there is for some schmuck who wants some more channels or more
power.

>Hams have plenty to say about those who break the regulations

boy, that's an understatement!!!

even if it doesn't concern you.
but i propose a 1/2 way meeting point between hams and 11 meter ops.
agreeing to the fact that hams have as much right as anyone to be here and on
cb.
if hams have something negative to say about the way that we want to "repair"
our radios, why don't you just click on the box that says "new message" instead
of posting spam-like responses directly to the question?
if someone "attacks" a ham or the ham community in a posting, THEN jump in and
defend yourselves. no one would expect anything less.
but if a guy asks which pins to ground on an 8719, don't come back with all the
legal bullshit. it makes the ham community sound foolish like if someone asks:
Q) what color is an orange?
A) aluminum!
there is no ELECTRONIC OR TECHNICAL connection between pins 9 an 10 of an 8719
PLL and part 95 of the fcc rules. only in the minds of the RF police does this
connection exist.
please don't answer a question that wasn't asked,
POST IT AS A NEW MESSAGE INSTEAD!!!
DEAL???
I HOPE SO. SO MUCH OF THIS DIALOG BATTLE COULD BE SAVED FOR COMMON ENIMIES LIKE
THE REAL RF COPS PROPOSED IN CONGRESS.
jeff

I'm trying to identify the model of my first rig. I think it was
a
HB-23a. I recall that it was 23 channel, xtal controlled on both transmit and
receive. All tubes, base model. Front facing speaker grill was
sort of a blue/turquoise color. This was a earlier model than Lafayette's "Comstat
" models. Anyone out there in dxland who can help me document
with a pic and reprint out of the catalog?
Received my first NAL from the fcc on this rig, when I was 13
years old, sort of like a "Citizen Cane/ RoseBud" thing.

Any help would be greatly appreciated.
73/

first of all, I would like to thank you all for helping me choose the
Grant XL. Thanks to all who helped me.

Ive got a couple of questions about the Grant......

1. If I decide to get the power modified, what is the acceptable range
for a long life of the radio.

2. what mods should I NOT do? I hear good and bad things about
clipping the Modulation limiters. What is your opinion?

Thanks again and happy CB'ing

Cliff

>barefoot.

The palomar 225 and 350 both are not designed to take a deadkey of over 2-3
watts.  I would have you dead keyed turned down to 2 watts or even less to get
the best performance out of your 225.

The station who wants to know what Base station radio to
have, with killer audio, i would go for a Yaesu FT 1000mp.
There is someone selling one on the rec.radio.cb. They
are very nice radios.

Cheers,   26 MU 791.

Matt!!!!!!!!!

Just curious. How do these new 100 watt internal amps dissipate the heat the
generate?  I know most radios design for 100 watts have heat sinks integrated
into the chassis and fan to assist the cooling. How do they overcome this
problem?

This is not a troll but would really like to know. I have a radio that I might
be interested in using one with, if they don't over heat the components in the
radio.

Look at the schematic again! You'll notice a diode that rectifies reflected RF power, and sends this negative voltage to the AM power adjustment pot. When more reflected power is present, the negative feedback increases and the power falls off proportionally. If that isn't a protection feature, then I don't know what is.

Hmm.... I've never noticed any problem with positive modulation from a 2510. The radio's amplifier is capable of producing between 40 and 50 watts peak power on SSB (after tuneup), and would produce the same carrier level, if the carrier were set to full on. With this in mind, peak AM modulation should also fall in the 40 to 50 watt range, which should allow 100% modulation of a 10 watt carrier. My testing on my own 2510 seems to bear this out, as I have no problem getting 100% (4X) peak power with a 10 watt carrier. The modulation envelope is "normal" at this level. Lower carrier levels of 4 or 5 watts, gives an even more peak power ratio if the limiter is not set to hold at 100%.

Generally speaking, most radios will lower total peak power, when carrier is dropped, unless a "swing" type mod is employed to bypass the AC modulation component (the capacitor) around the resistor that lowers the carrier level.

>
> On the other hand, the 2510 will show higher peak power output with a simple tune-up on SSB than a 2950. They have a nice, stable SSB sound too. If a guy could handle the lower tech CPU with its lack of features, and is only interested in SSB, the 2510 (or Lincoln these days) may be a better choice for some than the 2950.

The output of a 2950 on SSB is typically in the 35 watt range. The 2510 will easily top that by at least 10 watts (and with a single final).

>
> > The one thing that you do have to be careful of with a 2510 (and the President Jackson, which has virtually the same transmitter) is the power control circuit. The power control derives it's feedback from an SWR sensing diode, which allows the transmitter to back down the power when the SWR gets high, thereby saving the final. But an unpleasent side effect of this circuit is that under certain conditions, (such as the input matching of a amplifier) the feedback can be greatly reduced which results in the rig putting out too much power. This can cause overdrive of the amplifier, and the distorted sound you get when you have no forward swing and all back swing.
>
> That's interesting. I've never noticed that effect. My backup radio is a Jackson. I'll have to run it into some loads other than 50 ohms to see how it reacts.
>
> You'd figure the opposite of what you say would be true. On either side of 50 ohms, the control circuit should reduce the output. There shouldn't be a condition where the output increases.

Yes, Agreed, but what seems to be happening (and I don't have the equipment to verify this) is that you set the output power into a "normal" load, which is usually not a flat 1:1 50 ohm load, but rather, has some small reflective amount, but not enough to be problematic. Then when you change to the input matching of an amplifier, there is either a better match, or there are reactive components that "fool" the sense diode, and result in less feedback being generated and the power of the radio increases, which results in overdrive. I've wanted to bypass the feedback circuit so that this isn't a problem, but the power adjust relies on negative feedback voltage. Removing this causes the carrier to go full on. I haven't troubled myself enough to design a fixed negative voltage source to utilize, or to explore redesigning the carrier balance circuit. Since I haven't used my 2510 with an amplifier lately, further work in this area, have been back-burnered.

Nor are there any "functions" on front panel to facilitate operation of
a multi-PL encoder, if one were designed to work with this particular
model.

Thanks Tony for your response. Any other info you have about an escort? I'm
thinking about a Uniden PC68xlw with a K40 trunk mount. Nothing fancy but
your response did cause me pause.

Thanks again.

In my opinion, the modulation limiter cut is one of the worst things you can do to your radio. Yes, the audio will be extremely loud but this will be "dirty" audio, which you'll have problems controlling, and in some cases have people telling you it's too loud. The dirty signal (by dirty, I mean over 100%/distorted waveform-audio) tends to cause extra bleedover problems across the 40ch bandwidth and if you add an amplifier on top of that, it's possible that you'll have more enemies than friends. The best this you could do is run the cleanest sounding station in your area, and you'll be surprised how many compliments you get too. Once again, this was just my 2 cents -

Not that i would know anything about this radio......BUT,
you will get the best results from turning the audio pot all the way up and
then back it off a hair. Leave the deadkey of the radio between 2.75 and
3.25 watts and the radio will run for years to come.
Train

If you tighten up the passband of a receiver to the point of where you hear no static, the skirt would be 0Kc and you would have no signal of ANY kind get through!

And, quite possibly, you would still get static, (albeit limited) as it would find it's way from the IF chain into the sensitive audio section and be amplified their.

Actually they do care,using freqs you have no right to is what people get busted for not amplifiers and "grey" radios.

Once they put thier mind to it it is very easy to catch someone,they caught me on 27.505 about 5 years ago.

I agree.

Their is something about Johnson's design.

Heathkit used it in the DX-100. The things that you see on the Heathkit
that you like are duplicated on the Johnson Viking transmitters. The only
real differences is that their are some minor cap variations (actually their
are different RC circuits) in the audio chain to give it a slightly
different tonal quality (I like the DX-100 audio better), and the DX-100
uses 2X6146 for finals, whereas the Johnson has three.

Phil,

Got the tube. Thanks.

The Commander, Pride (Solid State) and Palomar 250 and 300A (Solid State) all had adjustable bias for each pair of devices.

You could really make one of those amps sing, if you knew what you where doing. I had many truckers sold on my work just after selling them one of those amps and tuning it (both the radio to the amp, and the bias to the drive level) together.

Your right. The higher Iq does make a difference on sideband.

Now, if you would only finish that 3CX3000 mobile! we would be able to hear you stateside!

hehe

No, not really.

I like the Penetrator, although it cannot take more than about 3Kw (it was originally designed to work with the Messenger Competition 1Kw 16 pill amp). It is a good antenna, with a wide bandwith. It also works wonders as the top section of an Antron!

The Wilson may just be a better all around antenna, if maximum bandwith and such isn't a concern.

Either or...

The noise generated by the engine (picked up by the antenna) would drain off the system just as much as static electricity would.

But, it is usually engine static that makes the problems.

FCC rules Part 95, Subpart D, paragraph 95.420 (CB Rule 20) states:

(a) You may connect your CB station transmitter ot a telephone if

you comply with ALL of the following.
    (1) You or someone else must be present at your CB station

    and must...
        (i) Manually make the connection (the connection must not be made by remote control):
        (ii) Supervise the operation of the transmitter during

        the connection:
        (iii) Listen to each communication during the connection AND
        (iv) Stop all communications if there are operations in violation of these (Rule 95, Subpart D) rules
    (2) Each communication during the telephone connection must comply with all of these (FCC) rules.
    (3) You must obey any restriction that the telephone company places on the connection of a CB transmitter to a

    telephone.
(b) The CB transmitter you connect to a telephone must not be shared with any other CB station.
(c) If you connect your CB transmitter to a telephone, you must use a phone patch device which has been registered with the FCC.

What?????????????
E field is same as axis.
E field is the polarization.
A vertical antenna is vertically polarized.
If you want horizontal polarization use a horizontal antenna.

Hello Gary: No cigar! Come on now lets see the equations and math! Lets see the
energy levels for a square CM or Inch and the range equation. What is the
insertion
loss of cars and trucks, and what would be the levels inside the vehicles?

This is a good subject, that needs to be figured out.

Jay in the Mojave

Coax length won't make a difference in the true SWR so make it long
enough to go from the rig to the antenna without sharp bends.

Always tune for maximum MODULATED output. Disregard the dead-key.
When you've squeezed out all the peak (modulated) power you can,
then set the dead-key for your application (low for an amp or big
swing/high for no amp).

Bone stock. If you want more range, get an amplifier.

> 2. what mods should I NOT do? I hear good and bad things about
> clipping the Modulation limiters. What is your opinion?

I tried it, I put it back. If you like, you can rig up one of the lesser
used switches on the front to enable/disable it. I found by running it
stock you get the best allround performance.

I am a defender of a persons right to make a living, yes.

I am an defender of standing against laws that are rediculous in nature, don't REALISTICALLY hurt anyone, and make no sense.

I am a defender of the right to free speech (not for people to be able to run 100Kw to be able to carry their speech to the masses, but for someone to put up a web page to "show off" a fun sport of CB radio)

I am a defender of a persons right to knowledge, regardless of whether or not that knowledge <<could>> be used to make something illegal (inasmuch as a CB radio is concerned. I also know how to create miscellaneous explosives and backyard narcotics, but those are best left in the heads of the people who know how to do it... Dissimination of information is a touchy subject....)

I am NOT a defender of a person who maliciously attacks another, unless provoked.

I am NOT a defender of a person who "keys on" others.

I am NOT a defender of those who run splatterbox amplifiers.

Their is a lot of beliefs that we have in common, you, Joe and myself. However, I don't attempt to cram it down someones throat... I would prefer to educate someone.

If someone wants to run a 3CX3000 amplifier, let them... Educate them in the proper use, the proper way to set the station up to minimize interferience, and educate them in the proper way to construct said amplifier. That keeps them ALIVE!!

I don't believe in trolling a newsgroup looking for EVERYTHING that could POSSIBLY be construed as illegal and letting someone know about it. If they know how to turn on a CB radio and where to purchase a linear, they know it is illegal to run it.

That is their choice. They made it. It is not my job to tell them (yet again) that it is illegal. As one of the more technically minded and intelligent technicians, it IS my job to tell them how to run it correctly to keep interferience to a minimum, as well as prolong the life of their equipment!

So, that is what I do. If Bill where jamming a repeater for fun, no, I don't agree with him. If he was jamming a repeater because someone was throwing around profane language, then yes, I think he would be justified in doing so.

So would the FCC, I believe.

Toll Free

Another option is with a base loaded Wilson antenna (1000 or 5000), then
purchase the stinger with a coil in it.

This will bring the length down, but still provide better range than the Lil
Wil.

What you describe is a digipeater not a node. A node also
does not have a mailbox. There could be mailboxes on
different stations or even BBS stations. Although you are
close enough for CB.

Toll, please elaborate on this. What specific stinger w/coil should one
get? How would you specify this?

Dale.

Wilson makes a stinger that has a load in the middle of it, and brings the
1000 down to nearly the Lil Wil dimensions.

It doesn't have quite the TX and RX distance of the full size stinger, but
it does perform better than most any other antenna of comparable length.

If you want it, just request it from your local dealer.  Bills2way and
ExportsRUs should also be able to hook you up.

I picked this up at a thrift shop. Other than a loose connection in the microphone plug or jack (I'm not sure which, it makes the sound low volume), it seems to be either higher powered or not filtered or something. Basically I have it right next to my computer right now and when I transmit it makes the mouse move really fast in different directions. Neither of my other 2 GE radios do this. (They are supposed to put out 4 watts each, but I don't know how good they are.) It also seems to bleed over onto other channels more than the other radios I have. I'm thinking either some filter or something is completely blown or it's been "adjusted" for higher power or both? So, what do you ppl think? I will do a test tomorrow to see if you can hear it more clearly from a distance than my other car radio. (Naturally I'm not going to use it for more than a couple of seconds until I know what it's doing.)

As far as the loose connection, it makes the volume much lower unless I put pressure on the mic cord in the right up direction. I don't know if it's the jack or the mic plug. I'm not going to bother doing anything with that until I know this thing isn't shot. Plus the power meter jumps around a lot and seems to be just about useless.

Well, thanks for reading this. I hope I supplied enough information. I should put up another post tomorrow but I wanted to see what you'd say before I did the test.

Copper Electronics sucks in my opinion. I bought a 10 meter radio from them last year to the tune of about $150.00 all total with the modification book I needed just to open the radio up to the frequencies of the 10 Meter band (I assume this is legal since I hold a valid ham ticket). The radio was the biggest piece of shit I believe I have ever talked on, and I have talked on all sorts of radios in my time. Bottom line, beware of Copper and their bullshit antics, like suggesting that CBer's get on 10 meters and chat with the hams (I wouldn't recommend that you do this folks). Just one man's opinion, steer clear of Copper. I still enjoy C.B. from time to time, and I buy all my stuff from Scanner World out of New York and have never had a problem, plus the prices are reasonable.

How stupid do you think I am? I'm fully aware of the Chipswitch.
Buying and installing a chipswitch takes the cost of the radio
way above and beyond that of a 2950. In other words, a 2510 clone
with a chipswitch is not a better value than a 2950.

Hello RFEnforcer: What a joke you are, your just as corrosive as on the other newsgroups, as you are here. But I must say you are constant.

Freebanders and the so called 10 meter squatters, are like apples and oranges. Two different things. I tried like all get out to hear Illegal operations on 10 meters all I heard was Spanish stations not using call signs. The conversations on news.rec.radio.misc also don't like you, you must be a real jewel, he he he!

Your just another weak dick whiner.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

I have this radio and have a different experience. The radio has a backup power system built in that provides about 3 days worth of power in order to hold the programmed settings -- the owners manual speaks of this feature.

When I travel out of town, I park the car at the airport parking lot and remove the detachable head. I have been gone as many as 5 continuous days, returned to the car and replaced the head, and it lit up with my previous settings.

On the other hand, if you neglect to power off the unit via the on/off switch, and then turn the vehicle ignition off, the next time you power up the unit it will reset to a default setting. (The default is AM mode, ch 9, w/no extra channels, etc.) So, needless to say, you don't want to leave your unit on when you switch off the ignition.

Dale.

Hey dick,

Let's take a good look at your "facts" here.  Seems that you want to dredge
up old BS that has already been fought over, and was done with.  The most
recent thing that you brought up was from a year and a half ago!

>
> http://www.fcc.gov/cgi-bin/AT-fcc_websearch.cgi
```

>
> http://www.fcc.gov/Bureaus/Compliance/News_Releases/1998/nrci8009.txt

1997 to 98 taxi cab busts in New York..

Old news.

>
> http://www.fcc.gov/cib/News_Releases/nrci8009.html

April 27, 1998 ... Looks like the FCC was busy in '98.

Still, this is just another copy of the above.

>
>
http://www.fcc.gov/Daily_Releases/Daily_Business/1999/db990322/da990540.txt

A rehearing stemming from a problem in March of 1998. That scares me.

>
> http://www.fcc.gov/Bureaus/Compliance/Orders/1997/da971786.txt

1997... Boyee... I better get rid of all my stuff...

>
> http://www.fcc.gov/Bureaus/Miscellaneous/News_Releases/nrmc4089.txt

1994!!! Boy, that's a real threat!

>
> http://www.fcc.gov/cib/Orders/da971786.html

1997. At least that is a little more recent!

Oh I am sure there are some guys on 10 meters, I haven't hear any. The
roger beep, echo, and sound efects, I hear them all the time on the 2
meters repeaters from Los Angles. And yep I spin the dial quit a bit on
10, I have yet to heat any CB type transmissions. A lot Spanish guys are
out there.

I have this radio and have found this to be true! I run it with most of the mods (except the Q33 modulation limiter) using a Wilson 5000 mag-mount and a D104-M6B. When I power up during the daylight in AM mode, the SRF jumps up to about a 7 or 8. Sometimes it goes all the way to 10 and just stays there. I can still receive pretty good, signals seem to come in strong. But, the SRF is almost always pegged. If I hit the LOC button, the SRF drops to nothing, but I think the signals coming in are much lower and my receive is just not that good with that setting. If I am chatting with someone nearby, they come in just fine. Needless to say, I run with the LOC off most of the time and have the squelch turned way up.

I looked in to applying Lou Franklin's channel guard, but was told that it would not work with this radio. Does anyone know differently?? This is a GREAT radio. I guess I have convinced myself that maybe the SRF meter is just overly sensitive, and now I just tend to ignore it. BTW, SWR is 1.1 on ch 1 and 40, 1.0 on ch 19.

Dale.

Black people do not use the word NIGGER.

They use a butchered version....... "Nigga"

Their is a difference.

Nigga would be equated to a white person calling another white guy a "wood"...

Peckerwood is a word that black racist people usually reserve to call white people they don't like, but it is "OK" for a white to call another white a "Wood".

I am not saying that I agree with it, but that is the nature of the game.

hello readers, i was wondering how you tell if a Cobra 148GTL was made by uniden or not? i have an older 148 and would really like to know who really made it. and is there a way to get about 8-10 watts deadkey out of one of these things (and who can do it and make it sound better/clearer)
it allready has the extra chans (never use them, never will) and 1 more thing, can anything be done to filter the incoming signals more? the anl/nb does not do much on my 148. thanks all.

#1 power out is directly proportionate to what you want to spend. The more $, the more wattage.
#2 Worldwide when conditions are right but you do not need a linear for this.
#3 A couple hundred can get you into a reliable box.
#4 Pretty much connect your radio to your box and your box to your antenna. Assuming you are speaking strictly mobile, hook it to your battery directly.(do not even bother suggesting inline fuses or connecting to solenoid.)

Not with a lower deadkey.

The trick to burning up a radio is to keep the average power output high...

If you have a low carrier, the average power that the "final" has to put out
is low, but the PEP value can be high..... The PEP is an instantaneous
value, whereas the carrier is "all the time".

Hope that helps.

> Therefore, I was operating my station under a
> valid grant from the federal government

A valid CB license only gave an individual permission to use a certain segment of bandwidth according to various rules set forth by the government. It by no means gave a person the right to damage the real property of another while putting those very governmentally supplied and enforced rules in practice.

A perfectly silly example would be if two people were standing next to each other at a pond fishing. Both of these people have valid Fishing Licenses. Both of these individuals also have the legal right to engage in a normal attempt to catch fish according to the terms of the fishing license. While doing this, one fisherman crosses the line of the other, hence losing the other parties $10.00 fishing lure. Both parties were acting within the legal parameters of a Fishing License, however one of them clearly caused damages to the other. Regardless of any licenses, or to whom they are issued, this situation now falls under the Common Law category of "Property", which has a completely different legal result.

The guy who crossed the fishing line would have to pay................Just like the owner of the CB would have to pay the individual for the financial damages incurred by him as a result of the CB. Although, you are correct by stating that no one in their right mind would ever pursue such a course of action for something so minor, however there are those out in the world who'd love to make a name for themselves for exposing such frivolities.

> Therefore, I was operating my station under a
> valid grant from the federal government

A valid CB license only gave an individual permission to use a certain segment of bandwidth according to various rules set forth by the government. It by no means gave a person the right to damage the real property of another while putting those very governmentally supplied and enforced rules in practice.

A perfectly silly example would be if two people were standing next to each other at a pond fishing. Both of these people have valid Fishing Licenses. Both of these individuals also have the legal right to engage in a normal attempt to catch fish according to the terms of the fishing license. While doing this, one fisherman crosses the line of the other, hence losing the other parties $10.00 fishing lure. Both parties were acting within the legal parameters of a Fishing License, however one of them clearly caused damages to the other. Regardless of any licenses, or to whom they are issued, this situation now falls under the Common Law category of "Property", which has a completely different legal result.

The guy who crossed the fishing line would have to pay................Just like the owner of the CB would have to pay the individual for the financial damages incurred by him as a result of the CB. Although, you are correct by stating that no one in their right mind would ever pursue such a course of action for something so minor, however there are those out in the world who'd love to make a name for themselves for exposing such frivolities.

I can hear them any day the band is open, truckers on 28.085 and others
up and down the band, all the way up above 28.3, and these are not the
spanish stations either, these are state-side illegal cb ops.

Which is most of them. But for some reason, that's okay. Blacks who hate whites are "oppressed." Whites who hate blacks are guilty of "hate crimes."

Hey.... this is new information to me!! Either I overlooked this when I checked into it, or CBC has added 79-290 info within the past month or two. I had a tech check out the unit when I recieved it, I asked him about it and he said that it would not work. He may have been misinformed.

Glad you caught this! I will check into this ASAP and order if all is OK. I'll slame the thing in quickly and report back with results. Thanks Russticle.

Dale.

Well, there you have it.

It's always a good idea to power down radios with CPUs in them
by turning them off--then disconnecting them from the power source.
Turn them back on the opposite way: connect them to a source of
power, make sure that source of power is on, then turn the radio on.
With the 79-290, Midland builds in an incentive to do it that way.

None of them do, but that would be a feature that would
actually make the 2510 better than a 2950.

> i thought we were
> talking about ten meters only rigs.

We are.

> the only one i know about with the pll

2600s don't have PLL tones stock.

> i use my 2510 on ssb only and never use AM so thats not a
> concern.

Then you should know for a fact that as CBers are
concerned there's nothing that the Chipswitch does
that really makes the radio stand out in the group.

> here where i live were all near three major freeways and the folks
> with 2950's dont hear anything when the truckers with class c boxes come thru
> ripping stuff up.

That's crap. The 2950 receiver isn't as selective
as the 2510, but it's not like you're going to hear
people on the 2510 that you're not going to hear on
the 2950. I've performed experiments that prove it.
I've compared the 2950 to all the radios that are
supposed to have "hot" receivers. None are more
sensitive, most are more selective--but that's it.

> same situation when the dx is high and all the signals from
> 27.025 are 30 over 9. the radios with loose recives like the 2950 and other
> exports just dont cut it. if i was living in the boon docks by myself with no
> dx then a 2950 would suit me fine but thats not a real world scenario.

That's just more crap. When the skip is in like
that it doesn't matter what radio you're using--
the receiver will be burried in it.

I've used 2950s for 10 years. They aren't the
most selective receiver, and there are several
receiver stages where they should have used FETs
rather than bipolars so the no-signal noise floor
is higher than it should be, but they aren't THAT
bad. There are a few cheap mods that improve the
receive performance by about 10%. Having someone

who's patient and has good signal to noise ratio measurement equipment align it helps quite a bit too. Like I said, I've done tests that prove it. Some of the seemingly very quiet receivers won't hear fringe signals as well as a properly modified and aligned 2950. What some see as superior selectivity is just a lack of sensitivity.

In any case, we're both getting off the point. The Chipswitch certainly is not the reason why the 2510 types are more selective than the 2950. It's a wash. The receiver selectivity is countered by its lousy AM transmit performance. At best, the 2510s AM transmitter is the equal of the 2950s receiver. In other words, with the proper mods and tuning, the 2510 AM transmitter is okay just like the 2950 receiver. The Chipswitch doesn't improve the 2510s AM transmit performance. It doesn't give the 2510 PLL capability either. It gives the 2510 some memory locations and the ability to scan and search. Those are the useful features, but the 2950 already has those features. The rest is basically useless fluff.

The bottom line is that a 2510 with a Chipswitch is not a better value than the 2950, therefore it's not a better choice.

Remember, I did admit that if SSB is all you do, than a stock 2510 (Lincoln) may be the better choice. Personally, I stick with the 2950, but alot of people I know, mostly hams, prefer the 2510 types. That's why there's chocolate and vanilla. A radio choice always has to be based on what the person is primarily using the radio for. There is no one "best for everything" radio. There are always people asking that, and I'll try to answer it, but there will always be areas of the radios I recommend that can be nit-picked. The same goes for anyone else's choices.

Okay, I asked about putting a ant in my attic early. I was told about using
a dipole which I could do.

But I have a old Radio Shack Magnetic mount ant. . Could I take the magnet
off of it and use it. I'm wanting to get at least a 14 to 20 mile range
out of it. Would it work or should I put some ground radials on it.

I have plans for a ham ant. which is alomst the same idea except it doesn't
have the loading coil. It has 45 degree radials (4 of them), WOuld that
work w/ mine seeing that it has the loading coils..

Yes you can do it, but not really worth the trouble because you could sell
both of the Texas stars and just buy a bigger Texas star or whatever you
want. the reason the amp in the house runs hotter is probably because your
base antenna might not have a good match or the base radio might have the
carrier set higher than the mobile.

Well, I was really trying to be somewhat polite, but since you asked.

What it really sounds like is "YOU keyed up WITH intent to do do HARM and or
DAMAGE
to another persons property because YOU did not like what he said to you" ILLEGAL
in my book.

That puts you in the same category as all the CB'ers you like to scream at about
running illegal power. Therefore you have no right to preach to anyone about what
is legal or illegal, and every time you do it just shows your ignorance.

RFEnforcer wrote:

Here last time I monitored the bowl it was a dude named Over
Dose. He's been known to eject VCR tapes if he rides by
your house while talking.

I am looking for a decent radio to take hunting with, like to have max range
capabilities, I have been looking at the Cobra 45wxst, suggested by a
friend.
I would appreciate any feedback, thanks in advance

The big one today admitted to running 2KW. I couldn't reach him
with my 2 pill. Skip was so bad I couldn't talk anywhere today.

Somedays I get good conditions. Not today.

Do one of two things:
1. Leave the mag mount antenna on the car, and park it in the attic, or
2. Cut a dipole out of almost any conductive material, and feed it
through a 1:1 balun with RG 8 or RG 58. Cut the dipole long and allow
for a resonant point below the CB band, and this will permit you room
for error and to later trim it to tune. Using an antenna analyzer or swr
meter, calculate the resonant frequency, and do any trimming/shortening
needed to get it to resonance on your most commonly used CB channel.

A dipole strung flat 0ut will be rather directional. As you allow the
ends to fall, the antenna will become increasingly omnidirectional.

I have a co-worker of mine that won a 959 in an raffle, it's a nice radio all by itself.

I have a question. I have just ordered the Midland 79-290 for my car and plan on installing it in the dash board. My question is this: What affect will it have if I attach a cigarette plug to the power cord and plug it in that way over having it wired directly to my battery? I have a new car and I want to limit what I attach to the battery and run through the firewall. Will I still get the correct voltage (13.8)?

Allow me to quote a paragraph from
http://www.cbcintl.com/CG_Hookup_Info.htm :

The CHANNEL GUARD filters are a very effective way to stop one of the biggest problems with CB radios: splash, splatter, or �bleedover� from other channels. Our HF versions use two special high-Q crystals (7.8 MHz or 10.695 MHz) in series on a small PC board, which is installed at the proper circuit point in the receiver�s IF stages. They work by narrowing the �skirt� selectivity around the center of the radio�s IF passband. The filter is generally installed in place of an existing IF coupling capacitor, typically a 2-5pF ceramic disk type.

It's supposed to increase the selectivity of the radio on receive & prevent bleedover. Haven't heard bad about it.

I have a quick disconnect end on my power cord for my Galaxy 66 and my Uniden 76XL, I can use the CB power posts or the cigarette lighter in our trucks at work. You will get the power you need fine, although you do risk the chance of a little more electrical noise when receiving.

Should work just fine though, I use the cigarette lighter plug when I use
either of my radios in my pickup with no problems.

Hello and thank you all who read and can help me figure what this thing is and
if it is worth anything.
It is some sort of base radio, I think Citizen Band.
White in color and has am,lsb,usb swithes with a couple of meters and a bunch
of different knobs. too many to list, but I'm sure someone knows what it is
and the value if it works properly.

Thank you so much

:
:   Hear! Hear! I agree 100%! Personally, I remember the hobby the way
: it was back in the 70's. The FCC even then didn't enforce heavily, but they
: at least tried to provide some sort of enforcement. 1979 came along, and that
: seems to be when the FCC turned their back on the service. Now there's a
: proliferation of illegal noisemakers ("Roger" beeps, echo and reverb effects,
: etc), high power stations and illegally modified radios. It's about time the
: FCC stepped in and started cleaning up the spectrum!

I remember the 70s as well. It was during a low in the sunspot cycle, so there was relatively little skip.

11 meter CB will never function as originally intended. The capability of long range communication, even on 5 watts, ensures that the regulations will not be obeyed by everyone.

: You are correct with regards to radios but totally in the wrong where
: amplifiers are concerned.

Not totally.

: If you are caught with RF amplifier(s) in your possession which have the
: ability to operate on the 11-meter band and you do not hold a valid amateur
: radio license, you will be assumed to have used the amplifier(s) if there is
: ANY other evidence of it's use.

Such as monitored excess power. Correct.

: Do you know what "de facto" means? As in "possession of the amplifier is
: considered de facto evidence of it's use?" If not, you had better brush up on
: your terminology (and your knowledge of Part 95 as well.)

It is only "de facto evidence" if there is other evidence as well.

Simple possession is NOT illegal. If it were, then any Tech or Novice Ham
who possessed one would be guilty as well - as they cannot legally use high
power amplifiers on the HF bands.

: Therefore, why don't YOU do something about it?

Regardless of how you and I may feel about amplifiers, noise toys etc -
it does no good to post here preaching to people that they are illegal.
Almost everyone already knows that - and have chosen to operate their
stations illegally. No amount of posting to this group is going to
change the minds of anyone.

In other words, you are just wasting your time. If you get your jollys
out of repeatedly stating the obvious, then feel free to continue to do
so. Otherwise, I suggest that your time could be more usefully spent
elsewhere.

That's pushing it, though. The last thing you want to do is starve an amplifier. I'd recommend at least 30 amps. The Texas Star 250 comes stock with a 30-amp fuse (at least it used to), so this would be a good indication of the amount of current required. Astron makes a quality 35-amp power supply which would be perfect for this application.

Of course, this advice is intended solely for licensed amateurs who would use such a setup on the 10-meter ham band.

>meter repeater around has them?

"Courtesy tones" serve a useful purpose for repeater operations. Unlike simplex (CB) transmissions, there is no dropped carrier to signify the party has completed his transmission. If the transmitting station has a clean signal into the repeater, it can be impossible to tell when the party has finished his transmission unless a courtesy tone is used.

Exactly. In the 25 or so years that mainstream America has been familiar with CB, moral values and society in general has declined markedly. Everything is less civilized and more hostile now: CB radio, ham radio, driving habits, behavior in public, etc. Expect this trend to get worse in coming years. Eventually, you will either need to "pack heat" or you will be a crime victim. This is already the case in a growing number of large American cities.

Me thinks we're going to get both. Within the past six months, several NALs have been levied against hams who operate illegally in the freeband.

Illegal is illegal. It is just as much of a violation to transmit on 27.555 as it is for an unlicensed operator to transmit on 28.085.

they speak english in Canada too.
you could concieveably hear Canadian truckers in the U.S. or U.S. and Canadian truckers in Mexico or Central America for that matter too which is outside your jurisdictiction, deputy.

oh, and one other thing.
if you live in iowa because you don't like the crime in new york, you would stay out of new york wouldn't you?
if it's such a crime to be on the free-band, you would NEVER go there would you?
if you don't go there, don't put your brown nose there to bother us.
if you monitor there and wanted us out, and were sucessful, then all you would hear is dead air there.
a sane man wouldn't keep monitoring for long and leave.
you would probably be the like the maytag repair man and stay to paTROLL those freqs anyway.

The only "message" you put across is "I am incapable of having an intelligent debate on the facts of an issue. Instead, I resort to profanity, name-calling, and worn-out catch phrases ("show me your badge, sheriff", etc.) to try and advance my inferior argument."

Note: this address does not accept unsolicited e-mail. Please contain all discussion regarding USENET posts to the appropriate newsgroup thread.

>>This is major attraction
>>that ham radio does hot have.
>
> Ham radio is VERY friendly. And the idiot ratio is MUCH lower than
>CB.

in the interest of saving space and time,
take HOHOHO,HAHAHA and replay it for 10 minutes and then continue reading:
BULLSHIT!!! those stiff nosed, tight assed hams wouldn't give you the time of
day unless they could use it to inflate their chest / pride. if you want to see
friendly, look at the posts that ask a question and then look at who answers it
and how.
if it's a "cb" question, most hams except the neutral ones are quiet and offer
NO help. if it's a question of channels, power or other mods, the real assholes
come out and post a bunch of static and SPAM,(un-solicited) crap unrelated to
the posters question and mostly in a smart-assed way.
if you can convince anyone about the "friendlyness" of these hams, i want their
e-mail address. i have some elevated, waterfront property for sale in brooklyn
ny.
it has a strong stone foundation.

>may also want to review the type acceptance requirements for radios sold in
>the US. I'm of the (possibly mistaken) impression that no radio may be made
>commercially available in the US without FCC type acceptance.

there is NO law that says that i CAN'T buy, own, or sell, "FOR EXPORT USE OR SALE" an 11 / 10 meter radio or amp.
the law only says that i can't USE them.
if i had my house FULL of these units, i could invite an fcc inspection of my house and they would leave empty handed because they would not find one in operation or offered for sale in the U.S. at the time of their inspection.

Sounds like this guy is a CB failure.I guess he couldn't get anyone to respond to him on Super Bowl. When he bought his ham ticket (he doesn't sound smart enough to pass the test) he now feels superior.So he gets on the net (he still isn't able to get out on the CB freqs.) to down the very thing he tried so hard to achieve. Get on the porch pup and lick your dish, you're still not able to get in the middle of the street with the big dogs.

no, the only message that i'm trying to put across is that no one can get a message across on this forum without assholes like the RF police spamming and damning every question in here that doesn't represent pure cb.
we can't even do it in semefore because of the GLARE FROM YOUR BADGE, DEPUTY.
sometimes, it takes a little profanity to get you to SHUT THE FUCK UP AND LISTEN!!!
you and the other RF police should have your own ng so that you can post with someone that agrees with you because no one here wants to hear from you.

You are correct with regards to radios but totally in the wrong where amplifiers are concerned.

If you are caught with RF amplifier(s) in your possession which have the ability to operate on the 11-meter band and you do not hold a valid amateur radio license, you will be assumed to have used the amplifier(s) if there is ANY other evidence of it's use.

Do you know what "de facto" means? As in "possession of the amplifier is considered de facto evidence of it's use?" If not, you had better brush up on your terminology (and your knowledge of Part 95 as well.)

Hello Train: Yep your right there. I have read to many postings that people are complaining about the MaCo V5/8 assembly and matching. I have never assembled one. I bought one from Bills 2 Way back in February of this year. But in a few days I'll be putting my MaCo V5/8 together and matching it up. Already have 2 Penetrator 500's and my New Design 5/8, that's a Penetrator 500 kind of look a like. But uses a few different features to improve the mechanical strength, and a wider bandwidth, and is adjustable as to what frequency you want.

I'll let ya know how it goes, ah!

Jay in the Mojave

HHHHHmmmmmm......there seems to be an imposter among us. It seems to me that if some people spent more time building better amps and not cheating people out of money, they wouldn't be so damn bitter and desperate to feel the need to fake someone elses screen name.
Oh well, I guess some folks just have to do what they have to do. Now how does that saying go again??...."if you build a better mouse trap, the world will beat a path to your door".... I think the same thing might go for cb amps too.

the real 151

RE:Newbie Unfamiliar with linear amplifiers, any help?

ask yourself this question:
AS A NEWBIE, WILL I EVER GET A STRAIGHT ANSWER OUT OF RFENFORCER?

THE ANSWER IS: PRINT THIS ONE UP BECAUSE IT'LL BE THE LAST ONE YOU'LL EVER GET!!!
he is right, amps are illegal and there are stiff penalties for their use.
in the future, expect ANY post about amps, (should you choose to use one),
to be peppered with a bunch of bullshit, off the subject / wall crap about the legalaties of it. if you choose to use an amp, you do so at your own risk but don't let him or anybody snow/scare you. YOU make YOUR OWN decisions.
good luck.
jeff

A good ham 10 meter Yagi or triband Yagi is the ticket for skip,I use
a high gain TH6DXX,4 elements on 10 meters on a 24'boom.A balun helps
with the TVI and is standard equipment on most Yagis.Any 10M beam can be
modified(lengthened)for 11,just get 4 or 5 elements and the longest
boom,not a shortened boom like a lot of the CB fakes.These will blow
away an A99.

  Depends on the individual install,but if I use the pipes at my shack
the radio won't even work.I don't ground the rigs,I'm not suggetsing
that aproach but it doesn't work for me.

I would like to know if and how I can connect two Texas Star 250HDs together for more power.

I would like to also know why the 250 that I have hooked to 30A a power supply in the house runs much hotter than the mobile. Is something wrong, or is this normal? Thank you

Wouldn't it be much cheaper to go to your local Home Depot and get a UL
listed 10' ground rod and associated hardware? My radio shack charges me
X-tra shipping for long items. As far as that goes why don't you go all the
way and follow the national electrical code as far as jumpering the antenna
grounding electrode to the electrical service grounding electrode? as per
NEC 810-21 (f) (1) and 810-21 (j)?? Illegally installed electrical systems
can be used by an insurance company to deny a claim.

Not a bad idea...**IF** I were a commercial concern trying to promote a business and could write it off as a business expense.

I am not.

If you want to donate one, I will gladly award it to the person submitting a log with the most contacts and will post his/her name herein.

Good idea, though. Perhaps if this idea pans out and I get enough folks to respond, I will be able to bankroll such a prize next October 4th. But not this year.

Interesting.... I have the same amplifier.
I thought it was a homebream amp that someone put General linear system on it.
So this was a true production amplifier. Mine is integrated into a night stand.
We call it the furniture amplifier. It is ugly!! but will cook an Antron A99.

I will agree with most of what you said except using Copper as a price guide.

You can not use them in that aspect because they buy in such Huge quantities that they are able to get their stuff at a lot lower price than the average retail shop.
For example, WalMart sells the Uniden Pro-510XL at about $38-$40, and most distributors prices can't even sell them for what they are retailing them out because they buy them by the truck load, and most retail shops can not afford to do
that. Sure, a lot of the bigger truck stops like Petro, Union 76 and so on have cheaper prices for two reasons, they deal a lot in re-furbished units and they buy

them a truck load at a time, and then distribute them to their stores.
Sure Copper has good prices, but you have to be able to see what you will be
spending in the end when it is finally able to be put in your vehicle.

Hello Roger: Its not all that easy to go out and home-brew a 1/2 or 5/8
wavelength
antenna, and have the performance results that the store bought antennas have. I
tell this to you from years of experience and wanting to sledge hammer a few
home-brew antennas.

The store bought CB Base Antennas are usually designed by antenna engineers, and
have been tested on a antenna range. The MaCa V5/8 is great 5/8 wavelength ground
plane antenna, its cost is around 60 to 70 dollars. As a guy walking off the
street,
the aluminum tubing will cost more than that to get close to the original MaCo
V5/8
antenna assembly.
Then there is the vertical element insulator, mast mounting considerations, and of
course matching the impedance from the 50 ohm coax to the 5/8 antenna. Which will
have a SWR of about 21 to 1, without a impedance matching system.

I would suggest to purchase a MaCo V5/8, assembly it and use it. Then if your bent to improve it, experiment on it. Buying the MaCo V5/8 just for parts is a wise and inexpensive move. Please let me know how you make out here.

Jay in the Mojave

     My My My Bill,
It must be nice have such a fan club. I might have to
get another license and join in on all the fun. I've
pretty much conquered the cb fan club, I guess it's
time to get a license again and have some fun on 2 mtr.

Hello...I have a A-99 on top of a 65' custom made tower,(it came with the house, wider at bottom and narrow at top), I am not too happy with the antenna performance, much TVI too, even with a MFJ low-pass filter...I'd like to put up another antenna that would help more on TVI and talk skip better too...I also purchased a base amp , tube type rated at 1KW...So this would be a consideration also...Any help would be appreciated.. Skipmaster 725

Man I don't know Brian, Flipping those burgers at McD's must have really weakened your wrist. The weight of a 9v. batt is to much for you to lift? a whole what, 20 to 30 grams? Man I'm sure you're county has a program for helping out needy people with injuries such as yours. As far as replacing it ...I would think that must people go through one about one every year or two.

One more thing ..... I leave mine on the bench and just grip it or press down to transmit, why do you have to hold your mic?

The Landshark

P.S. It is nice to se that your still with us though.

Roger beeps are not illegal... Much to my surprise.

The Galaxy 959 comes with a beep and variable power... And it carries a type acceptance sticker!

Hello Skipmaster 725: I would suggest putting up a MaCo V5/8, this is a 5/8 wavelength ground plane antenna. I have heard to many stories that the A99 was replaced with a MaCo V5/8 and a noticable decrease in TVI resulted. I would also ground the radio to a good ground rod or water pipe.

Funny...

We can say the same things about your ethnic background?

But, rec.radio.cb is not a place for a showdown on racism, is it?

Their is a difference.... Call a black man a Nigger, and I seriously doubt that you would walk away in the same manner that you walked up...

Call him "Your Nigga", and if he likes you, you would be a good friend.

Kind of like the difference between a "Vato" and a "Vato"...

Border language (and the English raping of the hispanic language) makes a Vato someone who is your friend..... On par with a Nigga...

However, call a self respecting Mexican a Vato, and it would be along the same lines as calling a black man a Nigger.

Neither one is a very good term to know.

Just remember, if you want to be an asshole, people can do the same to you, Senor Lopez!

Excellent base station mic for sale..
This mic was made for TRAM Radio Corp.
by Turner and looks just like the Turner SSB+2
but is all black and printed on the mic in RED is
the word TRAM...currently wired for a Tram 4 pin plug
but of course will work on any radio...
This mic is just extra to my needs ..
make offer if interested.

No, I just don't plan on sitting by my base acting like mr. central
telephone patch operator.

My Vote........

For the "Best Mobile Antenna" goes
to the "Solarcon Thunderbolt", available
in 72" and 83" models!

Since the sun spot cycle is going to allow great DX over the next few
years, what is the FCC gonna do about all the latino RF coming in on
10 meters? You know that all those countrys in central and south
America use 10 meter radios for their taxis, etc...

Thats merely a coincedence..Technology changed and society as a hole went down hill at that time..Stopping the issuing of a license had nothing to do with it..You gotta still have tags and a license to drive and people are crazier now than ever.And thats in broad daylight where everyone can see them..So you can imagine how they are going to act hiding behind a mike invisible

I hope I did`nt brain my damage.

Hi guys,
I wonder if any stations out there use or monitor packet radio out there on 11 mtrs?
over here in Europe its quite busy on the frequencies of 26.840,830 and 810 LSB with legal packet on the frequencies of 27.235 245 F.M.
the baud rate is 1200 unusaual for H.F. nut CB ers over this way are hardly conventional.....
recent developments include the proposal for legal packet radio in the UK.....
Its already legal in Germany Holland and Denmark with a following all over Europe.Also I have monitored stations in Russia comming on-line and I wondered if a "Global" network would be a possibility.
With e-mail and the web being used as gateways, as in Ham radio and the progress of the sunspot cycle some contacts with the US would, I think be possible if there were stations to contact....
Do you know of any????

I am looking for unusual stations on CB packet.
Recently monitored on Sunday 3rd October was

SF9PJC*>**CQ** [UI,P]:
<TE 1.20> 1 SF9PJC & BBS & DIGI, FINLAND, Lapland 1 EU 1

on 27.235 F.M.
also
RUS000-8 a russian bbs of uknown location.

Please send me any stations you monitor from "far afield" especially if their beacons contain PO-boxes, web-sites or e-mails........as I am interested in QSL-ing these stations and gain information about the "NETWORK".....

Thanks for your time..
Please visit the web-site at
WWW.BCBC.U-NET.COM
for our progress.
All the best for the coming season.

Tony.

No, all Im doing illegal is running the radio with modulation limiter
removed.
So eat shit pecker checker!!!!!!!

Well I guess i`m just a big dumb ass.It turns out I had just set-up my Dave
amp with the incorrect drive and a weak ass radio.Thanks for correcting my
stupid post.I take it all back,Dave amps are the best and I`m just an asshole
for ever doubting it.

I must admit that regardless of my stance against illegal CB operations, I do enjoy an occasional monitoring of Channel 6. These operators are very "colorful" (no pun intended), with a language and an operating procedure all their own. On most days, they give signals as strong as local AM broadcast stations into into my cheap SW portable with just its whip antenna.

Who's "on top" of The Bowl in your neighborhood? The strongest signal right now seems to be coming from "Jack Johnson."

Hello & good afternoon Jay,
Hey, I was always told not to ground it to water pipes.
That if you had spurious emissions that it could radiate
through you're house as well as others. I always use a ground
rod, placed close to a gutter down spout.

>But, rec.radio.cb is not a place for a showdown on racism, is it?

No, it's not. In fact, one of the reasons I enjoy the radio hobby so much is because it is one of very few activities today where the race of the participants is not a factor. Let's keep it that way.

By the way, my previous followup on this subject was intended solely as humor.

Nothing derogatory was intended or implied. Just an observation of what I hear being spoken around my neighborhood by those of color.

Right. If you're using Radio Shack as a supplier, pay the extra few bucks and go for the UL-listed, 8-foot ground rod. The cheaper 4-footer is essentially worthless. Don't be penny-wise and lightning foolish. The shack you save will be your own.

You or your radio must not hear very well. The illegal operations of truckers and other stateside (English) transmissions from 28.0-28.3Mhz are frequent and well documented.

It is possible that the board and other parts will say "Uniden".
A TRC-465 (PC-122 clone) has "Uniden" clearly etched on the PC board.

i was wondering if it would be semi-safe to put 25watts PEP to an HD
linear, rated at 10watt deadkey input. i have no idea what the CB
deadkeys, but it has a 1969 final in it, the unit in question is a
Uniden PC66XL that has been really modified. and the amp i want to mate
the 66 to is a Cobra 350XL from coaxkid (palomar blue face type, HD
class AB1) anybody know if i would be safe to run this combo, or if i
would kill it?

I hope you don't mean that an inline fuse should not be placed between the
battery and the firewall.  This is basic safety!

What you said made me wonder. On his site,
http://www.cbcintl.com/CG_Hookup_Info.htm
He does list where to go in the radio for the 79-290. (misc ssb
section) I dont have a 290 (yet), but was planning to get one & the
guard as well. What was told that wouldn't allow the channel guard to
work?

Not using a fuse makes as much sense as worrying about the length of the
cozx.

Since that amp was probably built on someone's kitchen table, there is
no way of knowing here if it will handle 10 or 100. They are all
different, based upon the quality of construction. Just remember that
when you are dealing with illegally manufactured or modified equipment,
there aren't any construction standards to meet, so all bets are off.

Panther electronics sells a real nice kit to give that radio a perfect 40 up and down.
They can install it for you, I think it's $40 for the kit, $85 installed.

I never understood why these rados were bought by people that just get them and decide that they "need"to add channels. If they bought this kind of radio tyhey had to know that there were radios out there(Golly.....even a few Galaxy's) that come with the channels already there. I have NEVER been one for adding things to the radio that didn't come from the factory. The only so called channel kit I have ever seen that was worth it's weight and freight was the old "Digi-Scan" and those are no longer being made. I suggest if you want more channels, pick up a radio that has them in it from the factory and hqave less trouble in you radio life.

Hi Bill,

Use RG-8X coax instead of RG-8 and it will still handle plenty of power. You should use a standard ball and spring mount with around 18ft plus several extra inches of coax. This way allows you to cut it back to around 18ft for a good match if needed. Coax length doesn't matter if your antenna is a 50 ohm load, but the 102" whip is not, so your coax becomes part of the antenna and therefore coax length DOES make a difference. Good luck   Gordon

>the bottom line is that all people care about is price. most have there own local tech thats a favorite.

Not all people

> i dont need to have a mail order guy working on my radio. its been my experience that cb repair men are similar to auto mechanics in the way the charge and do business.

Alot of techs or so called techs do rip people off, but there are a few good ones out there. They just usually don't spam on the NG.

> all i want is a place to buy a radio that i'm already familiar with and then i'll have my guy work on it. after all theres no way to check a repairmans work quality if he's half way across the country. buy your radios from who ever has the cheapest price but never let somebody you dont know or trust work on your rig.

Buy your radio from a local shop that you know and trust that will give you comparable brices. A Copper radio or the like that is defective will end up costing you much more time and money than had you bought it locally anyway. On the other hand, you can use Copper as a price guide....keeps retailer honest and you in the know. Your Galaxy 99 may be $319.99 at copper, plus $15-20 in shipping. Therefore, $349 from a local shop that will stand behind the radio is a better deal, especially if you end up sending that mail order radio back.

>best regards, Tim 2-IR-082

Now Now Toll, Let's not confuse lack of verbal skills with meanings.
```

When they say "Gub-mint", they mean Government.

When they "Fiddy Dolla", they mean fifty dollars.

When they say "Am-boo-lanz", they mean ambulance.

When they say "Axe somebody", they mean ask somebody.

And last but not least, when they say "Niggaz", they mean niggers.

To suggest otherwise is to engage in politically correct "new-speak".

Sorry Toll, but "fax iz fax" (just a little Ebonics thrown in for your reading pleasure).

Hello Cbradeeo: I am sorry, I missed the part about helping people out getting their ham license, and by making ham radio very attractive by being friendly!? This is my exact point. Ham radio really shoots itself in the foot by being snotty and unfriendly. Pity.

Jay in the Mojave

I am currently running a homebrew 1/4 ground plane antenna that works well,
but would prefer a 1/2 or 5/8 antenna to acheive better results. Anybody
have some useable plans for such a antenna?

Ben,

  8-10 watts of dead key will
slowly burn up the 2sc1419 pass
regulator in the 148........

  If you are not using an
amplifier, 4 watts of dead key
with forward to 25 watts on am
is perfect!

Hear! Hear! I agree 100%! Personally, I remember the hobby the way it was back in the 70's. The FCC even then didn't enforce heavily, but they at least tried to provide some sort of enforcement. 1979 came along, and that seems to be when the FCC turned their back on the service. Now there's a proliferation of illegal noisemakers ("Roger" beeps, echo and reverb effects, etc), high power stations and illegally modified radios. It's about time the FCC stepped in and started cleaning up the spectrum!

>have some useable plans for such a antenna?

I will repost a method of matching the 5/8 wave antenna.

Take two short pieces of coax, Call them B & D.
50 ohm is fine.

The reason I used B & D is because the antenna
is A and the feedline coax would be C.

Imagine the hookup of A,B,C,D, left to right.
(See picture below)

B in feet =122/MHZ

D in feet =30/MHZ

A in feet = 585/MHZ

C = any length

#############

Form an intersection of B,C &D. Connect the center conductors
of all three. Then connect the shields of all three at the same
intersection. It should now look like the letter T with the feedline
being vertical.

Take the right side of D and short the center and outer conductor
together.

Take the left center conductor of B and connect it to the antenna.
Then connect the left shield of B to the *ground radials on the
antenna.

* Three or four nine foot sections

Cross fingers.

```
           A
              I
              I
              I__ _
              B   I  D
                  C

You apparently haven't been to many truck stops. These items are not in a hidden back room or under the sales counter out of sight. They are clearly and prominently displayed in glass sales cases. Of course, the current FCC initiative may serve to drive these items into those hidden back stock rooms and such, but that's better than what's going on now, and those who engage in the black market trade of these items WILL be caught.

They can be prohibited for sale in the US because they operate on the 11 meter band and are not type-accepted for use in the US on 11 meters. You may also want to review the type acceptance requirements for radios sold in the US. I'm of the (possibly mistaken) impression that no radio may be made commercially available in the US without FCC type acceptance. Hams are permitted to operate non-type-accepted radios.

>the commission has announced it intends to do.

Well John, I too have run clean CB for over 22 years. Congratulations on your Tech ticket. It's the first step in enjoying a wonderful hobby. Been licensed about 2 1/2 years myself and really enjoy it. I'm not as active in CB as I used to be, listen more than I talk (CB AND Ham), but I'm always out there. Maybe I'll catch on sometime. I see you're in 2-land. So am I. Work any repeaters in upstate NY?

The radio can Power up as a 10 meter radio or as a extened band CB depending on
the buttons you hold down during power on. Mine had a fair recieve as far as
CB radio selectivity goes. Where it lacked was from QRN or electrical noise
rejection
all installs I did with that radio were susceptable to ignition, CPU noise
etc...most cases it was very bad. Othere than that, the little dual final radio
really talked.
Mike

Does it have a low profile? Less height than most bases? Sounds like an older Midland to me.

What you have is probably the BEST radio around in it's time. If it is a COMPLETE station, the Communications Power Incorporated 2000 (CPI 2000) will easily sell for $300.00 providing it's all there and in tip-top shape.

hi andy. you must remember that the 79-290 is very sensitive to electrical
noise, going straight to the battery is your best bet for a quite recieve.

hi bill,
i'm not sure how you got to talking about what you did. i wasnt saying that the 2510 had a more sensitive recieve only a more selective one. here in a area around a lot of channel 6 operators and 3 freeways thats the most important thing. bill you can test and talk about them anything you want. are we supposed

to just take your word on every little thing, perhaps you only report what suits you. to me you sound like a 2950 dealer protecting business. i myself frequently enjoy the dual watch feature of the chipswitch as well as the ability to go from 12 to 10 meters in the same radio. with a few mods to the recieve of the 2510 and youll have a even better radio than the 2950 modded or not. all anybody has to do is open both radios up and look at them side by side. i would say that the difference in the heat sinks alone is a good indicator of which radio is higher quality not to mention the more heavy duty circuit boards and every other detail. if a person is a free band operator working from the mobile a chipswitched 2510 is the way to go. the seperate programable tunning steps make this radio a breeze to work while driving. i have mine set for a 5kc jump up or down when the button is pushed. what bill calls extra fluff are all features i use everyday. true enough if your just a AM'er that stays on one channel all day you may not need the 2510 but if your a serious side band dx'er theres no better radio in the class. the people i talk to dont even use am so bills argument isnt good for what we do.

CHIPSWITCH Enhanced Microcomputer.

The HR2510 / HR 2600 / LINCOLN 10 METER Amateur Radios manufactured by the UNIDEN Corporation of America do not encompass many of the useful and desirable features of the modern day Amateur radio. The Chipswitch IC is a custom microcomputer chip (integrated circuit) which is programmed to give new life and value to your UNIDEN radio.

30 MEMORY CHANNELS WITH TEMPORARY CHANNEL LOCKOUT AND REPEATER OFFSETS

The original HR2510 / HR2600 / LINCOLN has basically one memory available to it in the sense that it remembers the frequency you were last on during a power interruption. The CHIPSWITCH supplies you with three groups of MEMORY BANDS. There are now ten (10) user programmable frequency channels available for each MEMORY BAND. You can elect to have repeater offsets to any of the stored memory channels. You are also provided with the ability to lockout any memory channel(s) temporarily during SCAN/SEEK functions.

EXTENDED FREQUENCY COVERAGE
Adding the CHIPSWITCH IC will allow the radio to operate contiguously from 11 through 10 meters without any further modifications. Installation instructions are available for review.

With additional modifications to the PLL PCB, the CHIPSWITCH allows full contiguous coverage from 24.800 to 29.999 MHz. (12 through 10 Meters). Modifying these radios for use in the 12 Meter range can be done at a few sites. Although with the Chipswitch, these radios could be operable to 15 Meters, some spurs near 15 Meters cannot be adjusted out, therefore a password has been added to the Chipswitch program to disallow access beyond 12 Meters at this time.

PROGRAMMABLE SCAN/SEEK FUNCTION

The original HR2510/HR2600/LINCOLN allows you to scan on an arbitrary 'band basis." This new feature allows you to select a range of frequencies for SCAN and SEEK while in band 0, or SCAN/SEEK by memory channels in band 1, 2 and 3. The SCAN feature allows you to set the 'hold-time' (the amount of time the radio waits to resume its scan function after that particular frequency quiets down). The SEEK feature is identical to the SCAN except for when the radio is scanning and detects activity on a frequency, the radio will receive on that particular frequency for a user-programmed length of time before it continues the scan. SCAN and SEEK are completely user programmable for 5 or 10 kHz steps in band 0.

PROGRAMMABLE CHANNEL UP/DN BUTTONS

This provides you with the ability to program the radio's channel up and channel down buttons to change channels/frequencies in any of five (5) different ways. (5 kHz, 10 kHz, Underlined digit, etc.

PROGRAMMABLE MICROPHONE CHANNEL UP/DN BUTTONS

This provides you with the ability to program the microphone channel up and down buttons to change channels/frequencies in any on of eight (8) different ways.

SPLIT FREQUENCY OPERATION

When enabled, this allows you to transmit on one frequency, and receive on another.

PROGRAMMABLE TRANSMITTER TIMEOUT

This feature provides the radio with a built-in QSO timer. When enabled, it triggers a programmable timer the moment the radio starts transmitting. When the user-programmed length has been achieved, the radio will stop transmitting. To continue transmitting, just release and press the microphone PTT (Push To Talk) Button.

PROGRAMMABLE TRANSMIT FREQUENCY RANGE

This provides you with the ability to program a range of frequencies to operationally transmit on. In this mode of operation, you still have the ability to receive frequencies out of the user-programmed range, but can not transmit on them.

PRIORITY CHANNEL (Requires optional hardware)

Priority channel operations allow you to program any frequency (i.e. home frequency, etc.) and have the HR2510/HR2600/LINCOLN check this frequency while you are on another, at a user-programmed rate. This feature will not function properly without the optional PRIORITY CHANNEL BOARD.

MISCELLANEOUS

The 'SPAN UNDERLINE CURSOR' now has a 'phantom' 4th position (all 3 underline bars) cursor. This enables you to go through the band in 100 kHz increments. This 'phantom' 4th position is indicated by 3 cursors.

The 'SPAN UNDERLINE CURSOR' position and the underlined digit can be moved by pressing both microphone buttons at the same time. (Great for mobile operation)

The button repeat rate is now programmable.

The internal 'button beep' duration is now programmable from 0 to 0.5 seconds.

The 'RPTR' button on the HR2600, when depressed, will transmit the CTCSS tone to open up a repeater station. Repeater offset selection is required when programming memory frequencies.

The HR2510/HR2600/LINCOLN now has two function modes:

OPERATE MODE

This mode is the radio's normal operation mode.

PROGRAM MODE

The front panel controls are used to program information the radio will use during OPERATE MODE (i.e. memory channel frequencies, split channel, scan functions, etc.)

INSTALLATION

As the name CHIPSWITCH implies, the basic modification of the radio is the replacement of the existing UNIDEN microcomputer chip. A person proficient in soldering/desoldering techniques on P.C. boards is qualified. A comprehensive installation manual is provided. No modification to the front panel is required as all the new features are controlled by the existing knob and buttons on the front panel. The optional PRIORITY CHANNEL BOARD and 12 METER MODIFICATION KITS do require modifications to the circuit boards.

i think the person(you) who tells another person here on the board to be
prepared to give the info is the one with the attitude. nobody should have told
you just for that one remark.

>story..................hmmmmmm.

There's the problem, the lady, probably a neighbor never took the time to ask or let them know
that the offending party was causing the interference. Thats part of the problem today with
people. This woman was happily watching wheel of fortune or something to that effect, and began
to get intereferrance.

Since she Obviously found out where the offending station probably was, instead of maybe letting
them know what was happening or what they were doning to some of her household electronics. She
probably felt as she was attacked. What i mean by attack is that when an offending station
bleeds on the general publics home electronics they seem to jump to conclusions that it is
intentional, and feel as if they are being personally attacked. (And that goes double with other
radio operators). They get pissed and and either never confront the person(s) or get down right
pissed at the person cause Pat Saijacks' face is getting all fuzzy cause some one is talking on
a radio.

For Example: I interfered with a couple of my neighbors phone conversations. One day i was out
in the yard and he asked about my hobby (CB). He pollitely slipped in about how he

heard me a couple of times on the phone. One of which was a rather inportant phone call.

Now logically thinking on how to reply to his comment after apologizing about the interference.
I asked him how recently was it that this happened. Thinking that something was maybe wrong with setup, and i told him that. Also telling him that it would be benifical to him to tell me when that happens agian, if it does happen again so I could resolve a problem if it was a problem with my set up. I told him maybe something is wrong with the system and I'll check it out. A few days later I had checked into redoing my coax connections, and found out that the RG-8 I was using was crappy. i.e. hardly any shield, and losely woven, all around crap coax. So I went out and purchased some RG-213. That fixed the problem. A couple weeks later I had a chance to converse with my nieghbor and ask if he had any more interference problems. He replied no, and I told him what the problem was, and if in the future if the problem was to rear it's ugly face and I couldn't fix the problem that I would be glad to foot the bill for getting him some filters for the electronics I was causing interference too.

But, i will go on record to say though it's knot just cb'ers that get ripped on about interfering with nieghbors electronics. Any body with a transmitting antenna have the cross hairs put on them at first chance, when interference comes into play. Hams get it too.

Actually the theory of lightning which you present is not quite correct. It's in
the wording.
Lightning take the path to ground with the least resistance to ground. I.E. The
more positivly
ionized air paticles That makes the pathway for the discharge to follow.

Shortet path would be a straight line and the highest point. And we all know that
lightning does
not follow a stright line.

Nonsense. Once the transmitting station has completed his
transmission, the repeater's carrier will drop within a few seconds
(the exact time determined by the length of the repeater's "tail").

If you aren't capable of determining when the 100-watt FM carrier of
that repeater has dropped unless it spoon-feeds you some sort of noise
to specifically inform you of that fact, try cleaning the wax out of
your ears.

I operate 11m CB on AM and SSB as well as simplex and repeater
operation on 2m and 70cm. The ONLY time that a courtesy tone serves a
useful purpose (out of the above) is on 11m SSB when there IS no
carrier in the absence of modulation - such as when the transmitting
station pauses between words or sentences.

A "roger beep" is no different from a courtesy tone on a ham repeater.
It's purpose is to inform LIDS that the person they are talking to has
finished transmitting, since they are incapable of determining that
fact with their own unaided ears. The exception, once again, being in
SSB operation when there is no carrier in the absence of modulation.

My neighbor has got a CB antenna running from his roof. When he is on his CB he causes interference with our local broadcast television reception. Channel 5 is the worst, and we can usually hear what he is saying, along with causing bad snow in the picture and knocks out the broadcast audio. On the other chanels, we usually only get the snow.

Other times we can pick up his broadcasts over our phone lines. I understand this guy is zealous about his hobby, but it causes 'line noise' interferes with my hobby of using the internet.

Anyway, this guy is on for HOURS at a time and the whole time, our broadcast channels are unwatchable and I get knocked offline.

I know this is a violation of FCC regulations regarding interference, but what can we do about it? Who do we report it to?

I would appreciate any info you can provide. I really don't want to interfere with this guys hobby, but it's really not fair that his hobby interferes with ours.

I have the following Radio, and electronic equipment for sale. Will consider trades for Hand held Scanners with full 800 coverage. All Gear working last time tested unless noted. Shipping is extra. Please reply to my email address.
Thanks
EJ (KC5EPI)

All Tube Items:

Tempo-1: All Tube Ham Transceiver with Power Supply. Covers 80-10 meters. Looks good and works well. $200

Pearce Simpson: Guardian 23- All tube CB Transceiver/with mobile power cord and mounting bracket. Looks and works Good. $100

Channel Master: Tube Stereo Receiver (Model 6612) and matching amp (Model6601) Looks good and plays on FM only. AM not working. $100

Non Tube Items:

HTX-202: Radio Shack 2 Meter HT. Works good. Slightly chipped where the battery slides in, but does not affect operation. No nicad, but I will include the AA Battery pack with the unit. $80

Marantz Model 2220B: 25 year old Stereophonic Receiver, with gyro-touch tuning, blue dial and optional real wood case. This unit is in excellent condition, both in looks and operation I would rate a 9.7. Also have original manual, in excellent condition. $200

AR Inc: Stereo Amp, All solid state. $100

Traynor: Group Two B- Audio Amp Head. High/ Low misc. in puts. Master volume, volume, bass, treble and tone shaper controls. All solid state $125

Swan 14X DC Power Supply Module: No way to test but was told it was working OK. As is $50.

Siltronix Model 90-6 VFO: Excellent condition with three position crystal switch $75.

PRO 2003 Scanner: Radio Shack 50 channel(30-512 Mhz.) Digital Scanner with FM broadcast band included. Have two, one is working the other is a complete non working unit. $150 for both.

Bearcat 250 Scanner: Have two. One working at times and one for parts. $50 for both.

i have 2 CBs converted to 10m, a Cheroke CBS1000 and a Cobra 148GTL, but
i never bother to use the extra chans, all i need is good ol 17, the BS
chan from hell. so my view is the 10m stuff is just useless unless your
a DXer
or HAM. and a ham wouldnt use that cheap converted CB shit! </sarcastic>
i love my CBs, i just hate those stuck up hams! long live CB radio!

(god i regret posting this with my real name... i can feel the flames
from here...hehe)

Hi there,

I`ve been looking around for a good deal on a handheld (or hand held) CB radio. I can get the GE 3-5980 at around $25.00. Does anyone have anything positive or negative to say about this radio? I`d like to hear it VIA E-MAIL.

Or if you have a handheld unit for sale please

```
e-mail me.

> OOs (ARRL based Operational Observers) in my area are out to get a particular repeater system (4 repeaters total on 145, 223, and 440). The system involved has a rowdy history. Any operator on that system is subject to harassment. OOs are part of the ARRL Amateur Auxiliary which reports directly to the FCC. With Hollingsworth at the helm, two negative OO reports is all it takes to generate a "friendly" (meaning: based on no real evidence) warning letter.

Oh, an OO letter. That's a bit different from an NAL or any "official" FCC action. In my area, we tell the OO's to cut up their "pick slips" into 4 inch squares and wrap them on a roll in the bathroom, and then go find a life.

We've had a few of our guys receive OO letters, relating to our somewhat rowdy conduct. The worst that they can do is give us hell for not Id'ing every 10 minutes (Hey, I'm not a clock watcher). What we talk about isn't obscene(but tends to get a bit racy), or violates part 97. So just because we aren't doing the usual geek thing ("Hi, Hi, Fine businees OM, are you destinated yet?"), these stuffed shirts have to understand that they have no business trying to censor our content, as long as it doesn't break the rules, regardless about how they personally feel about it.

We do have one guy that occasionally goes a bit too far when he starts playing WAV files from South Park, Howard Stern, and a Grandpa AL Lewis, "Fuck the FCC". I'm waiting for the axe to fall there. It's lucky we talk on a fairly obscure 2 meter simplex frequency....

I'm really surprised that the FCC would blindly act on the "word" of an OO. An OO's judgement is highly subjective, and unless they are dealing with an obvious clear-cut rule infraction, I would think the FCC would request more information before passing judgement. In the past, OO's reports have resulted in the FCC being dispatched to investigate, and NAL's would be issued if the FCC found it necessary. I would hope that you will counter the accusation if the claim is groundless. The FCC is really exposing itself to a libelous situtaion, if it publicly represents this action as the truth, when it has yet to be proven.

I was at a hamfest yesterday. I saw no less than 12 "CB type" amps for sale. Most were small 2 pill mobiles. What did catch my eye, was a vintage triple power D&A Phantom, a Palomar Skipper 300, and a HEC 500. Reminded me of the glory days....

Of course the people that owned them may not have been hams, but the point is that at a hamfest, the only thing that matters is $$$$$$. It doesn't matter who you are or what license you have, as long as your money is green.

It's not "totally" legal. You admit to having no modulation limiters. That means that the modulation will exceed 100%, so you are illegal. Carrier power is only one facet of technical compliance.

Even if the radio is an older 23 channel radio, which many times did not come with limiters from the factory, you are still required to make reasonable attempts to maintain a 100% modulation maximum.

The interference you are receiving may not be in violation of any law, but it I'll bet it is very annoying. There are several things you can do to try to protect your TV reception. If you are on cable; call the cable company to have them check the system. Check all the jumpers between your VCR and TV and cable box and disconnect anything connected to the TV one at a time. Often the VCR is prone to RFI rather than the TV. If you are not on cable, attach a good HI-Pass filter between the antenna and TV. Get square ferrite chokes from radio shack and wrap all of your cables in them. Try to determine where the RF is getting into your system. Is it the AC line, the antenna line, or do you have extension speakers, or a Home Theater sound system hooked to your TV? Any of these paths can be vulnerable. Start by just watching the TV alone with nothing else in

line. Ask your neighbor politely if he will assist in the testing process. He may be a completely legal operator, in which case, YOU need to prevent the interference to your unprotected devices. Contact the manufacturer of your TV. Often they have kits you can install to prevent RFI. The FCC has an interference handbook available, which has lots more ideas. You can probably get info on it at the FCC website. Good Luck!
Please reply direct by removing nospam from my address...

Thanks,

Brian

Is Channel 2 in use locally? If so, this should be the worst of all since it is almost an exact second harmonic frequency of CB. But Channel 5 would be second worst since this falls near the third harmonic. On the other channels, you're simply experiencing front-end overload of your television.

Not necessarily. It is only a "violation" if he is running excessive power or otherwise operating his radio illegally.

Don't believe me? Why don't you call the FCC? They will tell you that a stock SBE Console II of 1976 vintage was very much legal to run at any modulation level since this radio was NOT required to be equipped with a modulation limiter.

That depends on your size and fighting skills. Could be he walks away in worse shape then when you walked up. It sounds to me that you have been taken in by the "Black Physical Superiority" stereotype. Don't be afraid of them Toll, they bleed just like you and me.

>
> Kind of like the difference between a "Vato" and a "Vato"...

I have absolutely no idea what "Vato" means. I am fluent in English and Castilian (Spanish). The term "Vato" has no meaning in either language that I'm aware of.

>
> Border language (and the English raping of the hispanic language)

Correction: That's "Spanish" language, not "Hispanic" language. By definition, there is no racial distinction in the term "hispanic". A hispanic person may speak Spanish, however, a hispanic person may or may not *BE* Spanish (Iberian-European-Caucasian). That is why I have never liked the term "hispanic". It's like inventing a term that suggests that Negroes who speak English are Anglo-Saxons.

You continue to confuse race with nationality. A Mexican is a citizen of the country of Mexico, not a member of a particular racial group. As a matter of fact, most Mexicans are pure blooded Indian with no Spanish ancestry whatsoever. Those that are Spanish/Indian hybrids are called Mestizos.

>
> Just remember, if you want to be an asshole,

Oh Gee Wiz!!! How can I possibly counter such a well thought out and eloquently phrased argument???? I know....I'll invoke the undefeatable " I'm rubber you're glue " defense!!!! That'll show ya!!!!

My point (which you obviously missed) is that if a particular group of individuals finds a particular term offensive, and demands of another group to desist from using the term, then the first group must expunge the term from it's vocabulary *before* demanding the latter do the same. To demand otherwise would be hypocritical and racist in it's own right. If they are unwilling to take the first step, then they should just *GET OVER IT* and stop getting so incensed over other's use of the term based on the color of the users skin. After all, you don't hear people of Spanish heritage or of Jewish heritage calling each other "My Spic" or "My Kike" do you?

people can do the same to you,
> Senor Lopez!

Yes, well...so what! I practice what I preach. Frankly, I don't use any of the above terms. Not because I'm careful not to offend anybody, but because they have simply never been part of my vocabulary. As for what others say and think about me......I've grown way beyond caring my friend.

Hasta la vista (Shalom) baby!!!

I have installed a PC68ltw. I am new to this CB stuff. Can you explain what
"Dynamic Squelch Control" does? Is it just a preset squelch level or is
there any intelligence there? Does it do what "Sound Tracker" does on the
Cobra equivalent?

No you can't.

Just try to keep your coax as short as possible to minimize losses.

Very little. The swr is flat at Channel 1 and slowly goes up as the frequency increases. If you operate primarily on channel 1, well, you are in great shape. Otherwise the antenna might be a tad long and there is likely some adjustment available to you. Check to see if there is a set screw anywhere at the base of any portion of the antenna and if so, drop the antenna down into the well as far as it will go and then check it again. Avoid any trimming until you are sure of what you are doing, and then only an eighth to quarter inch at a time. You would like for that flat spot in your swr to be where you spend most of your time, but if you use all the channels, try to get it flat around channel 20 and all will be good.

I've seen it on a number of CB mod websites. Do a search for CB mods and you'll find it. Just make sure you have a good frequency counter available when you do that mod so you can center the control. In other words, it's not a "cookbook" type of mod where you simply do A and B automatically happens. There is some adjustment required.

Carl, You give me much to much credit ! How can someone use your AOL screen name and aol account to post in your name unless it is you. If you think I have time to make up names other than what you see me post under 10-7" then that is your problem and you are very paranoid. It is obvious after the Bullshit about the wdc break someone is trying to start shit somewhere along the line and have it blamed on me. I recieved the same e-mail as everyone else did If i have had anything to bad say about BB or you or Dan i will say it to your face. Now as far as building amps we know in this lifetime you will never build anything better than dave , Instead of worrying about other peoples money maybe you should not cheat your partner out of any money since he is the brains behind the operation. If it wasnt for him you would still be selling pirate amps. BTw how long has the motorola book been out? Pretty long time huh. Well then if that is the case you should have been using that design years ago on your own without daves or dans help. If you want to keep this up let me know but please only reply to anything 10-7 write because otherwise you are replying to someone else's bullshit and not mine. Have a good day, Tell Dan hello and as far as key on you later I think we are even in that dept 1-1 See ya next year

Do you live in the same house as him and plug your radio in the same outlet? NO! Then you can't possibly encounter the same conditions as he does. Don't put down a product just because a store that you don't like sells it. Many radios are manufactured at the same plant and have different names put on them. For example: the Bearcat Trunktracker Scanner is also sold at Radio Shack. The only difference is the name put on the case. Maxon 2 meter mobiles are made at the same factory in Korea as the Radio Shack HTX-242. They are the same radio with different names.

Of course they can't all be mighty Uniden radios, now can they? Hmm.. I wonder how many other radios carry the insides of the mighty Uniden radios but have a different name on it... Hmm.. now that I think about it, I believe a few of the "Rat Shack" radios as you put it are the identical radio as some of the Unidens.. gee, imagine that. I guess they must be pieces of crap too...

Blue Face amps aren't pieces of crap.

What you're looking for is some old unbiased thing from the 70's.
I have a box full of those. They all need power transistors. I'll
sell you one for $20. Put a pair of 455s and a variable pot in it

and you'll have your modulator. Add a simple diode-based bias
circuit that you can switch in and out for SSB use.

I was wondering if their is anyone that would be interested in traded a
2 month old 575 for a D-104? I have the box, receipt from JCRE, and the
warranty card. If you have questions please let me know. Thanks.

Does anyone know, what these letters mean, and what will happen if I change
the position of VRs signed like these?

Thanks
Rafal 161PT586

What radio is it?
ALC=Automatic Level Control (for AM)
AMC=Automatic Modulation Control (for SSB)

The radio's abilities not mine,I have won my catagory in the ARRL 10
meter contest for Montana 3 years in a row and beat all surounding
states but 1 guy in Wyoming.I almost kept up with the college multi-op
station from Bozeman and they were running 1,500 watts compared to my
low power classification.I also only used 1 antenna.
  Point is I'm not that great an op but I know what I'm doing.I know a
Cobra 148GTL etc will operate on 10 and work well on the freq and mode

its operating but there is so much more fun to be had with a rig that
will do more.

Yawn.

Please see below...

> > No you won't. You see different SWR readings due to voltage standing
waves
> > on the coax... Not due to the losses in coax!
>
> Let's paraphrase this statement: "You see different standing waves
> due to standing waves."

No, you see different standing waves due the the fact that the voltage levels on the coaxial cable are different in different spots due to a mismatch at the other end. This is not because of losses!

>
> The only reason you get different readings is due to coaxial losses.

Bullshit. Show me one coaxial cable manufacturer (Belden or Andrews, please) that would state the same thing.

As a matter of fact, the Bird catalog states something entirely different.

I leave it up to you to do a little investigating.

> The Standing Wave Ratio is, in essense, a measure of the ratio of
> the reflected power to the forward power.

Exactly! Not a ratio of the forward power to the losses in the coax!

If what you state was true, the following would pan out.

100 foot run.

75 ohm antenna (1.5 to 1).

Run 100 feet of RG-8 and take a measurement.

Run 100 feet of RG-58 and take a measurement.

Guess what! THE READINGS ARE THE SAME!

Try it.

Your wrong.

The only way these power
> levels change is through losses.

Bullshit. The power levels are different because of the fact that the
reflected power goes through voltage minimas and maximas. If you measure
VSWR at a point where the current is at a maxima, the SWR will appear to be
low.... When in fact it is not.

Try using an RF Ammeter to measure these things.... Or add a 4 foot section
of coax to a mismatched feedline.

You will see some different things! And the loss from a 4 foot slice of
coax is negligible at 27 megs. That is something else that you can find
from Belden or Andrews!

>
> > > but it has nothing to do with whether or not the antenna is reactive.

That statement proves that you know not what you spout!

> >
> > It sure as hell does! If you are dealing with a nonreactive, 50 ohm
> > antenna, you will see the same SWR across the feedline, no matter where
you
> > measure it.
>
> Now you are adding more conditions to create the perfect case where
> there are no standing waves.

No, these are called facts. Some people (unlike yourself) deal in them.

Welcome to reality. You can check yourself in at the door.

>
> You originally said "reactive". How is a a reactive antenna impedance
> any worse than a non-50 ohm resistive antenna impedance? The answer is
> that it isn't.

Bullshit. If you have reactance on your feedline (40 ohm Z with +10j), you will see an impedance of 50 ohms. Their is a mismatch, though. However, the antenna will radiate its best because it is "resonant".

This is where (at the least), a noise bridge comes in handy!

>
> > If you have a reactive load, the swr will only be duplicated from the
> > feedpoint at every multiple of an electric half wavelength away!
> >
> > That is a simple law of physics.
>
> That is simply not true and you cannot produce any physics to prove it.
> You are confusing impedance with SWR. The impedance is duplicated
> every half wavelength. The SWR is constant at all lengths.

I suggest you read the ARRL handbook for the radio amateur, the ARRL antenna handbook, any issue of the ARRL antenna compendiums, the Radio Handbook by William Orr or a multitude of simple CB radio books. Not to mention the Bird and Coaxial Dynamics literature.

So far, the engineers of the world are against you.... You ready to take on Newton next?

All the texts above support what I say..... Who is backing you up?

>
> > > A mismatch is a mismatch regardless of whether it is reactive,
resistive
> > > or any combination thereof.

Bullshit. A mismatched antenna that is totally resistive is resonant. A mismatched antenna that is reactive is NOT resonant. If you don't know the difference between a resonant antenna and one that is not resonant, I suggest that you stick to your simple VSWR meters and go no farther than 4 watts.

> >
> > Not totally true. You can use a stub of coax to tune out positive
> > reactance...
>

the
> > hardest to tune out without a network!
>
> You can use a coaxial matching transformer to tune out most any reasonable
> impedance (e.g. no shorts or opens).

Ahh yes.... Use reactance to tune a resistive load. Simpleton method of
doing it.

The correct way would be use an "L" network (at the least). You can build a
simple LC circuit, right?

>
> I can match a 40 ohm impedance with a quarter wavelength of 44.76 ohm
coax.

And that is a handy number, isn't it?

> But that is not what we were discussing.

Your right, but while where at it, I thought I would school you some more.

>
> >   There is nothing different about a reactive
> > > antenna impedance other than the fact that it is by definition a
mismatch.
> > >

Yawn... Once again....

> >
> > Sure their is... A reactive mismatch means that the antenna is not
resonant
> > on that particular frequency...
>
> Yeah. So what?
>
> > A mismatch due to different impedances will indicate that the antenna is
> > resonant at a certain frequency, just not resonant with a feedpoint of
50
> > ohms!
>
> Again, this means nothing.

And again it proves that you don't know the difference between resonant,
reactive and SWR!

>
> > That would be the effect of tuning for maximum field strength, rather

than
> > tuning via an SWR meter.
> >
> > > Also a mismatched antenna (not 50 ohms) is not a necessary or

>
> It does not. If I terminate a transmission line with a 40 ohm resistor,
> there are no currents on the outside of the coax.

So you are saying that a Balun is unneccesary?

Or are you saying that if you have an antenna that is 10 ohms, you don't
need a matching network?

Or are you saying that an antenna that is RESISTIVE 50 ohms, and not
reactive in the least will not have outside currents...

I agree with the last statement, but that is rarely the case because FEW
CBers actually use a noise bridge, antenna analyzer or field strength method
to tune an antenna. That is where reactance comes into play, and where
common mode currents start to misbehave.

  The current is reflected
> back down (inside) the coax. A mere mismatch does not cause current to
> flow on the outside of the coax; there is no correlation.

A mere mismatch doesn't... A reactive load CAN!

(notice the different words there....)

  Current on the
> outside of the coax is caused by other factors like a poor counterpoise
> or imbalanced antenna currents.

Which a reactive load can present.

>
> > The other side of the coin is where you use a length of coax to become
an
> > impedance transformer.... That is where you use a piece of coax TO BE A
> > PART OF THE ANTENNA.
>
> I would not consider a coaxial matching transformer to be part of the
> antenna. It does not radiate or receive any power.

Bullshit.

Try to run a piece of coax that you are using for a G5RV down the side of a grounded tower.

You have a tower, right? If so, give that a simple try... It would even work with a dipole, as a center fed, horizontal dipole doesn't terminate in 50 ohms... You use a quarter wave transformer to get the feedpoint their.

>
> Better watch what you say, the CLP will arrest you!

I care?

Have a good one.

AMC = Automatic Modulation Control/AM

ALC = Automatic Level Control/SSB

On some boards the ALC also controls
peak output on am as well!

Your exactly opposite.

The AMC controls AM.

The ALC controls SSB..

Turn either one up too high and you make more distortion than useable power output.

The Washington was also sold under a "Rat Shack" name.

he is another asshole troll that has not a single clue as to the CB radio
industry.

Toll Free

Yeah, but it would point it directly up!

That would be the wrong way.

I can see it if you where using it for sheilding of the rest of the house.

I have a Sonar BR-21 Linear amp for sale.  I have no way to check this
out so I cannot say if it works or not.  Looks good for being an old
tube amp.  It has two tubes that I can see through the case.  Price $ 85
plus s/h  from 48089 MI  Thanks.

"only too visible and obnoxious stereotypical operator"

And that would be a blanket comment about the CB radio community.

When you first said it, you acted (and it read as) a comment directed at the
CB community..

Guess what....
```

When you call everyone on a newsgroup a CBer, that means that you think that
they are all CBers!

See how that works? You make a blanket statement, don't attempt to retract
it and save face when someone calls you on it.

> >
>
> I am perfectly capable of thinking for myself, and have held these

Co, if we go throught he entire statement history, it will show where you
DID represent this as fact, even quoted part of the US Federal regulations
so as to back up your allegations.

Once again, you made a statement, and are now attempting to make a graceful
retraction.

Sorry, I hold people to what they say, and you stated that roger beeps where
illegal.

O.K., so in essence, what you are saying is that roger beeps are now legal..

Just wanted to get that straight.

  I don't have a
> problem with that either, provided said tone is properly modulated not to
> cause interference on adjacent channels.

I think that we are in agreement with that.

  My objection to the so called roger
> beeps are the multi-beep sequences that one can hear 10 channels away and
> which go on for 3 to 5 seconds at a time.

Those aren't roger beeps, they are "PEE" tones, or multitone beeps.

I don't run one. I hate them. To me they are about the same as the "Roger
Poot:"

  THESE are the tones I consider to
> be against the spirit of the regulation cited above, not a single short
> duration tone.

O.K., but that isn't what you said. You stated that they where illegal.
That was the point I was trying to make.

> >

You want an explanation for that?

"People that use the multi tone roger beeps have little imagination or are
trying to make up for another deficiency, which I won't go into here".
> >So, looks like you regurgitated something that you read, misinterpreted
it,

>
> >Have a nice day.
>
> Hmmm, too bad I don't feel as charitable as you. I'm sure you could
> guess about the day I hope you have...
>

Well, that is too bad.

Although I am an asshole, I do mean whatever I say. Just because you where
wrong about a statement that you made doesn't mean that I hope you have a
shit day.

That is what separates men from children.... Men can disagree and then go
have a beer together afterwards.

Children can't. They hold grudges and act immature.

He was purposely marketing this amp on this newsgroup to take
advantage of the market here. The market being the Hams that
hover in this newsgroup and rarely visit the amateur groups. I think
you are one of them.

Is there a site that lists schematics for radios. Currently I need the
schematics for the following radios. Galaxy 33V, Galaxy 88HL, Super
Star 3900. Any help would be appreciated. Thanks! Jon.

Go to the CBCity International web page.

He sells a complete set of service manuals for the Uniden based export
radios, with schematics for them in blueprint format.

Toll Free

Ray,

First off, you sound like a mina bird... You have come up with nothing constructive but to put down CB operators since you came on this group.

That is something to be proud of, isn't it?

Now, let's go below and find out that you are a flipping idiot that is incapable of thinking for himself and merely regurgitates what other hams have told him over the years....

Sure sounds to me like Roger Beeps are illegal

>>>Where?? Seems to me that if they where illegal, the two type accepted Galaxy radios that had them in the radio from the factory would cease to have a type acceptance sticker, wouldn't they? Kinda blows your whole argument out of the water...

The feds approved the radio for use on the standard 40 channels. It has a roger beep. It is legal.

Therefore, the correct corrollary would be that a roger beep is legal!

See below for your misinterpretation of the codes:

>
> Consider, if you will, the following selections from FCC Rules Part
> 95, Subpart D.

>>>>O.K., yes... Let's consider it:

>
> Para 95.412(b) You may use your CB station to transmit a tone signal

>>>So, the tone of a roger beep is legal... Can't be illegal to transmit a
tone, if it falls under certain reasonings... Those are explained below:

> only when the signal is used to make contact

>>>No, the roger beep doesn't do that (but, a device called a "Buddy Beep"
years ago did), so that must not be what makes it legal.

or to continue communications.

>>>Hey, guess what? It does help in continuing communications! How about
that!

> (Examples of circuites using these signals are tone operated squelch and
> selective calling circuits.)

>>>>These are just examples, and god knows that examples are not the end-all
for the rules!

If the signal is an audible tone, it must last
> no longer than 15 seconds at one time.

>>>And a single tone beep (which the FCC has already ruled as being legal,
since they type accepted the Galaxy radio (949 and 959) is a lot longer than
15 seconds... . More like 1/4 to 1/2 a second! Makes it legal, don't it!

If the signal is a subautible tone, it
> may be transmitted continuously only as long as you are talking.

>>>>Well, that wouldn't apply, as the roger beep is audible. Not to be
confused with a CTCSS or PL tone!

>
> Para 95.413(a)You must not use a CB station--
> (6) To transmit music, whistling, sound effects or any
> material to amuse or entertain.

>>>>So, the single tone roger beep is not for

a. Music
b. Whistling
c. Sound effects
d. Entertainment.

The single tone roger beep is designed as a EOT (End Of Transmission) tone. And, the FCC (once again, I must continue to reiterate this.. . Seems that drilling is the only way to get something in your head) has ruled that they are legal!

> (7) To transmit any sound effect solely to attract attention.

>>>>Well, the roger beep is used for signalling the end of a transmission under adverse circumstances (High QRM or QRN).

So, looks like you regurgitated something that you read, misinterpreted it, and should now feel like a total ass.

The bottom line is that the FCC has type accepted a roger beep equipped radio, and that is that. They did not issue a recall on it, it serves a purpose (unlike yourself), and people will use it both for real and assinine purposes.

Whether hams choose to use it or not is at their discretion. I have run across people that didn't like mine. I turn it off. Others have asked (albeit rarely) for me to turn one on.

Whatever floats their boat.

>
> Sure sounds to me like Roger Beeps are illegal.

>>>>And it sure sounds to me like you are acting like an ass. The FCC type accepts them. How are you going to say they are illegal?

Have a nice day.

> You may see a different SWR reading due to the coaxial losses

No you won't. You see different SWR readings due to voltage standing waves on the coax... Not due to the losses in coax!

> but it has nothing to do with whether or not the antenna is reactive.

It sure as hell does! If you are dealing with a nonreactive, 50 ohm antenna, you will see the same SWR across the feedline, no matter where you measure it.

If you have a reactive load, the swr will only be duplicated from the feedpoint at every multiple of an electric half wavelength away!

That is a simple law of physics.

> A mismatch is a mismatch regardless of whether it is reactive, resistive
> or any combination thereof.

Not totally true. You can use a stub of coax to tune out positive reactance...

Harder to tune out negative reactance....   Must use a coil to do so.

Of course, if you have a 40 ohm antenna with NO reactance, that would be the hardest to tune out without a network!

There is nothing different about a reactive
> antenna impedance other than the fact that it is by definition a mismatch.
>

Sure their is... A reactive mismatch means that the antenna is not resonant on that particular frequency...

A mismatch due to different impedances will indicate that the antenna is resonant at a certain frequency, just not resonant with a feedpoint of 50 ohms!

That would be the effect of tuning for maximum field strength, rather than tuning via an SWR meter.

> Also a mismatched antenna (not 50 ohms) is not a necessary or
> sufficient condition in order for the coax to become part of
> then antenna.

It sure as hell is!

Starts playing hell with the currents on the line! That causes current mismatches on the outside of the coax (in some cases), which in turn cause the coax to become part of the antenna.

The other side of the coin is where you use a length of coax to become an impedance transformer.... That is where you use a piece of coax TO BE A PART OF THE ANTENNA.

Their are other amateur arrays that use the coax as both a tuned stub as well as a piece of the antenna.

>

I've been running a converted Cobra 19XS for almost 10 years
on 10 meters CW and have reports from all over the world. By
the way it only runs 3.5 watts.

I agree. Build the better CB amp, and the world will beat a path to your door. Dennis has probably been telling you that as long as you've been in business.

Dave Made is your first duck. Better them in as many areas as you can
and you'll rule the CB amp business.

The Blue Face 350 is not rated at a 10 watt dead-key input.

> i have no idea what the CB
> deadkeys, but it has a 1969 final in it, the unit in question is a
> Uniden PC66XL that has been really modified.

It should have been set so that the dead-key is not that
high.

> and the amp i want to mate
> the 66 to is a Cobra 350XL from coaxkid (palomar blue face type, HD
> class AB1) anybody know if i would be safe to run this combo, or if i
> would kill it?

You'll kill it if you don't run the amp on a low output
setting. The amp will stand a dead-key input of 5 watts
topps. The PEP input can be very high. You MUST limit
the AM dead-key input to 5 watts.

The trick is to buy your amp from a guy that knows how
to match your radio to the proper amp. A 10 watt deadkey
means that you're trying to match an amp to a 10 meter
radio.

Thanks to all for the excellent info.

We have asked him repeatedly about the interference. At first he was interested in coming over and trying to help, and at one point he made a comment like, "Well, I guess I'll have to turn the power back down to 3 watts". I don't remember what the exact number was, but in the course of conversation he stated whatever the number he said he was going to come down to was the legal maximum for CB broadcasting. After this we had no interferance for a week or so then it started again and slowly it started getting worse and more frequent. I guess this is the reason I was going with the "FCC regulation" angle. It just seems like he started cranking the power back up.

Anyway, I will explore the filter option and see what comes of it.

Again, thanks for the info and the advice!

You need an electric line filter connected to the receptacle that has the CB connected to it. The interference is probably evident in every electrical outlet in your house when the Nintendo is on. Radio Shack sell a pretty good unit for about $14 (If you open it up you'll see that its nothing more than a string of electrolytic capacitors wired in parallel)

PS. Try using some cheap snap-on computer monitor baluns first. They worked for me on a couple of similar situations I had due to interferrance coming from compact flourescent light ballasts.

Dynamite will blow down only when elevated. On the other hand, sky-earth lightning strikes normally generate from the ground. Toll Free was correct. The problem is that the lightning will take the course of least resistance at the moment, and it is rarely what WE anticipate to be the course of least resistance. That's why a kid can be standing in a field 50 meters from a power pole and get zapped, while the pole continues to stand untouched.

I think it has a lot to do with the situation.  In the coming years,
interference from US CBers on 10 meters will be miniscule compared to
the interference coming from the southern hemisphere.  And guess what,
the FCC can't do a thing about that particular problem...Especially
since NAFTA passed!!!

Try to talk to the guy.  Ask him if he has a TVI filter on his
equipment and if he doesn't could he please get one.  If that doesn't
help, tell him he needs to get someone with more radio experience than
him to come over and properly tune his equipment.

If your attic can accomidate a 5 foot antenna, then the firestik IBA-5
might work for you. It costs around $39.95. I have had reasonable
results with it. You would probably get better results because you
would mount it higher than I have mine.

I don't know if anyone posted a power/foot spec. on the KW7. You would have to model it. As far as i know the only numbers that came from modeling this antenna came from me a couple of years ago.
I don't recall any models other than the ones i made. I could be wrong?
Anyways the easiest way to show the difference between a KW7, and a 102" whip, is to show jpg's of each antennas currents.
They are attached here.

> [Image] (Firestik.jpg) showing curve moving away from top
>
> [Image] (fullquarter.jpg) showing curve tapering off at top

Scott (Unit 69) wrote:

The first one is the KW-7, wouldn't that have a better radiation pattern then the 1/4 wave whip? Would explain the gain over the 1/4 wave.

I believe the guy modeled a 1/4 wave whip.

The slow motion I've seen of lightening shows a stepped
leader from the cloud to the ground. Once that leader hits
the ground, the earth shoots a bolt back to the cloud using
the warmed ionized path the leader took to the ground.

From the content and presentation of his posts, Matthew appears to be a very young lad whose posts can be overlooked for their inanity. Note the clipped graphic of the FT1000MP, and his indication that it was his personal radio.

The law CAN be changed. Happens all the time. BTW, the wording I SHOULD have used should have been "They can be prohibited from being COMMERCIALLY available in the US..." Slight difference in wording, large difference in application. BTW, why buy something you're not planning on using? If someone buys an illegal amplifier, I think I'd be better than 95% accurate when I figure that guy's going to USE that amplifier, and he's going to use it illegally. Especially when it's being sold to a non-ham licensed CB operator...

Consider, if you will, the following selections from FCC Rules Part 95, Subpart D.

Para 95.412(b) You may use your CB station to transmit a tone signal only when the signal is used to make contact or to continue communications. (Examples of circuites using these signals are tone operated squelch and selective calling circuits.) If the signal is an audible tone, it must last no longer than 15 seconds at one time. If the signal is a subautible tone, it may be transmitted continuously only as long as you are talking.

Para 95.413(a)You must not use a CB station--
    (6) To transmit music, whistling, sound effects or any material to amuse or entertain.
    (7) To transmit any sound effect solely to attract attention.

Sure sounds to me like Roger Beeps are illegal.

I agree completely! Add an amplified mic. but leave the
limiter intact for the optimum communication effectiveness.
I assume what Bill wants is to be heard better, not just to sound
louder. (Being louder does not necessarily mean being heard better,
especially if your signal is being badly distorted by overmodulation.)

Besides, over-boosted AM/SSB signals sound like the worst sort of
crap and splatters everywhere. It's loud all right. Why anyone with
pride in their gear would ruin a perfectly good stock sound (at most
requiring a good amplified mic adjusted to drive the limiter into
limiting) by defeating limiters and overdriving their radios
is beyond me. It does not sound good, it splatters energy that
should be going into your useful passband onto adjacent channels,
reduces the intelligibility of the signal instead of helping it,
and generally makes you think they don't have a clue about how
to adjust their own equipment.

If you want range, wouldn't you be better off with more RF power
instead? Obviously, linears are illegal, but so is defeating limiters
and overmodulating your carrier, which can really make the signal
"dirty".   Given my druthers, I'd rather have a neighbor running
50 watts of very clean RF to them running 200% positive modulation
and over 100% negative modulation at 4-8 watts and generating
harmonics and spurious crud all over the radio spectrum.
I'd take bets that the first base station operator is less likely to
be caught, too. For what it's worth, that's my opinion. Free advice
does not come with a money-back guarantee, however, so use
at your own risk! ;)

>Why do hams have such a problem with roger beeps on HF when every 2
>meter repeater around has them?

The tones on 2-meter repeaters are not "roger beeps." The courtesy tones are used to allow other operators a chance to get on the repeater. The theory of operation is as follows: At the end of a transmission, when the repeater detects that a transmission has ended, it will pause for a few seconds, giving listening parties a chance to announce their call signs. After a few seconds, the repeater issues the courtesy tone, thereby signalling the other party in the QSO in progress that it is clear for him/her to transmit. Each party of the QSO is expected to not transmit until they have heard the courtesy tone.

Oh, and the tones generated by 2-meter repeaters are not over modulated, do not splatter across several KHz of spectrum, and don't carry on like some novelty musical automobile horn.

Yes. Changing the length of the coax does not affect the SWR.
It is a fact.

Nonsense, on HF SSB there is a complete and total absence of tones to signal the end of a transmission. HF operators depend on the context and normal flow of conversation to determine if a pause has indicated the end of a transmission or is simply a pause for thought. Of course, many HF operators signal the end of their transmission with some sort of intelligent indicator, such as "back to you", or "go ahead" or even their (gasp!) callsign!

You may see a different SWR reading due to the coaxial losses
but it has nothing to do with whether or not the antenna is reactive.
A mismatch is a mismatch regardless of whether it is reactive, resistive
or any combination thereof. There is nothing different about a reactive
antenna impedance other than the fact that it is by definition a mismatch.

Also a mismatched antenna (not 50 ohms) is not a necessary or
sufficient condition in order for the coax to become part of
then antenna.

The CLP has it right!

:
: I know this is a violation of FCC regulations regarding interference,
: but what can we do about it? Who do we report it to?

He may be totally in compliance with the FCC regulations. Consumer
electronics have little protection against rf - it saves the manufacturer

a few pennies on each set.

There are things you can do at your end that may minimize or eliminate the problem. For example, install a high-pass filter at the input to your TV. Buy the interference filters for phones that are available at Radio Shack, and install them on your phone lines.

There are a bunch of other possible cures. If you have access to the Web, go to www.fcc.gov and look up the pages on interference. It has a fair amount of good information - including pointing out that it is often the consumer electronics that are at fault.

> > You may see a different SWR reading due to the coaxial losses
>
> No you won't. You see different SWR readings due to voltage standing waves on the coax... Not due to the losses in coax!

Let's paraphrase this statement: "You see different standing waves due to standing waves."

The only reason you get different readings is due to coaxial losses. The Standing Wave Ratio is, in essense, a measure of the ratio of the reflected power to the forward power. The only way these power levels change is through losses.

> > but it has nothing to do with whether or not the antenna is reactive.
>
> It sure as hell does! If you are dealing with a nonreactive, 50 ohm antenna, you will see the same SWR across the feedline, no matter where you measure it.

Now you are adding more conditions to create the perfect case where there are no standing waves.

You originally said "reactive". How is a a reactive antenna impedance any worse than a non-50 ohm resistive antenna impedance? The answer is that it isn't.

> If you have a reactive load, the swr will only be duplicated from the

> feedpoint at every multiple of an electric half wavelength away!
>
> That is a simple law of physics.

That is simply not true and you cannot produce any physics to prove it.
You are confusing impedance with SWR. The impedance is duplicated
every half wavelength. The SWR is constant at all lengths.

> > A mismatch is a mismatch regardless of whether it is reactive, resistive
> > or any combination thereof.
>
> Not totally true. You can use a stub of coax to tune out positive
> reactance...

I don't see how your statement makes any part of my statement "not totally
true".

> Harder to tune out negative reactance....   Must use a coil to do so.
>
> Of course, if you have a 40 ohm antenna with NO reactance, that would be the
> hardest to tune out without a network!

You can use a coaxial matching transformer to tune out most any reasonable
impedance (e.g. no shorts or opens).

I can match a 40 ohm impedance with a quarter wavelength of 44.76 ohm coax.
But that is not what we were discussing.

>   There is nothing different about a reactive
> > antenna impedance other than the fact that it is by definition a mismatch.
> >
>
> Sure their is... A reactive mismatch means that the antenna is not resonant
> on that particular frequency...

Yeah. So what?

> A mismatch due to different impedances will indicate that the antenna is
> resonant at a certain frequency, just not resonant with a feedpoint of 50
> ohms!

Again, this means nothing.

> That would be the effect of tuning for maximum field strength, rather than
> tuning via an SWR meter.
>
> > Also a mismatched antenna (not 50 ohms) is not a necessary or
> > sufficient condition in order for the coax to become part of

>
> It sure as hell is!
>
> Starts playing hell with the currents on the line! That causes current

> mismatches on the outside of the coax (in some cases), which in turn cause
> the coax to become part of the antenna.

It does not. If I terminate a transmission line with a 40 ohm resistor, there are no currents on the outside of the coax. The current is reflected back down (inside) the coax. A mere mismatch does not cause current to flow on the outside of the coax; there is no correlation. Current on the outside of the coax is caused by other factors like a poor counterpoise or imbalanced antenna currents.

> The other side of the coin is where you use a length of coax to become an
> impedance transformer.... That is where you use a piece of coax TO BE A
> PART OF THE ANTENNA.

I would not consider a coaxial matching transformer to be part of the antenna. It does not radiate or receive any power.

But, no matter what you call it, the original topic was not about matching transformers; it was about the desired coax length for a 102" whip -- presumably a 50 ohm coax (not some other impedance which would be required for a matching transformer). Changing the length of the 50 ohm coax will do nothing to improve the SWR (disregarding the coax losses I already mentioned). So, in light of this, you will want to simply minimize the length of coax used to minimize your losses.

> Their are other amateur arrays that use the coax as both a tuned stub as
> well as a piece of the antenna.

Who cares? Why do you guys keep bringing up all this amateur stuff?
This is a CB newsgroup.

> > The CLP has it right!

A better antenna is cheaper, but a small box will help.
A better antenna and a small box, and you might make it
out of the neighborhood! <:

The antenna is the weakest link. A cheap radio on a good antenna
will out-talk a good radio on a cheap antenna.

HINT: Base loaded magnet mounts suck. While they do work, a 1/4 wave
whip or a KW-7 Firestik or any whip longer then 6 1/2 feet works better.
My Firestik out-talks a 1/4 wave whip. It's been tested and proven.

(Flame shields on!)

 A word is a word and has nothing to it other that the intentions behind it.
 I find that people that tend to take offense to that word, usally tend to act
like that word. Not
that I'm saying you are, hell i don't even know you. But a word is a word, and
that is all it is.

That is actually half true, there are cases that lighning discharges up-ward, but
most discharge
to ground.

Simply not true. The antenna impedance does not determine if your
coax becomes a part of your antenna system; other factors do.

Furthermore, the coax length does not affect the SWR.

Just keep your coax as short as possible to minimize losses.
Adjust your antenna to minimize the SWR.

You don't really believe that changing the length of the coax won't
effect the SWR when its attached to an antenna that doesn't match the
characteristic impedance of the coax do you?

Am I to assume that you have a KW-7 Firestik? That's what I use and
it kicks butt! I also have a Wilson mag mount in the closet for a spare.
That's where a spare should stay! Base loaded mag mount. Trash!

Question to the NG: Someone posted a breakdown of the amount of power
emitted per foot of antenna, stating that more power comes from the
bottom of the antenna. If that were the case, wouldn't a fluorescent
tube light at the bottom easier than the top of the antenna? If the
voltage peaks at the end of the antenna, more power would be emitted
from the top, right? I was once zapped by the end of a ground radial
of an antenna I made (with 3 watts!), so I know the voltage is higher
at the end of the wire.

I'm trying to track down the address and phone number for Trader Joe's CB shop in Youngsville, North Carolina. Anyone familiar with it?

I'm going to be in the northeastern part of North Carolina for about another two months. I can't find a good, reliable CB shop around here. Anyone know of any others that might be an alternative to Trader Joes?

Thanks in advance,

Mark

And at that point, you where still illegal because you "cranked up" the D-104.

This would cause you to be above the 12 watt PEP limit of SSB (if it was on SSB) and 16 watts PEP on AM.

Also, you would have to fall under the "Cannot cause interferience" clause.

So, even if your station didn't have a limiter in it, you would still be illegal.

Face it, you did it with malicious intent, and that makes you just as much of an asshole as the rest of us CBers!

Can anyone out there help me out? I live in a antenna banded subdivision,
but want to setup a 11 meter base for local information and the like.
My problem is...What is the type of antenna I can hide it my attic [1 story
house, tall attic]?

Any suggestion? Home brew is more along the lines of my funding!

Thanks

The master of disinformation, Senor 2879 is at it again!

For the record, I tell this asshole nothing...

Now, on to the info...

To hook up both the amplifiers, you will need 2 100 ohm 2 watt resistors, 2 100 ohm 1/2 watt resistors, a splitter and a combiner (all available from RF parts).

The splitter will take the input to your amps and split it off, 180 degrees out of phase, and feed it to each amplifier. Across the splitter, place the 100 ohm 1/2 watt resistors in parallel to each other, one side each on the inputs.

The same thing on the outputs...., only use the larger resistors and a combiner (which is just a splitter rated at higher power).

If either of the resistors get more than barely warm, you have an imbalance. The input side (splitter) will be caused by a set of amps that are not drawing the same. This can be caused by (small effect) beta of the transistors, bias of the transistors or other things.

On the output side, it is usually caused by the transistors being from a different gain lot.... In English, this means that one set of transistors may be doing 250 watts and the other set doing 240 watts.

The little resistors going across the splitter / combiner serve to equalize the currents in and out of the amps, as well as give you an indication of balance.

Better yet, sell the amps or purchase a larger amp.

Outside of the attic would be better. People have successfully used
disguise antennas like a vent antenna, or a 18" dish antenna, or a
flagpole antenna.

If inside is what you want, then try a spare mobile antenna with
additional nine foot radials at the base. If you want to make a
antenna from scratch then take approximately a nine foot vertical wire
radiator, and three or four nine foot ground radials. Trim the
vertical wire for best match. However this antenna may be interfered
with because of the close proximity of the attic. Because of this you
may not be able to get a good match no matter how you trim it. The
best solution for this antenna would be to use a antenna tuner before
you trim the antenna down to nothing.

>of an antenna I made (with 3 watts!), so I know the voltage is higher
>at the end of the wire.

I don't know if anyone posted a power/foot spec. on the KW7. You
would have to model it. As far as i know the only numbers that came
from modeling this antenna came from me a couple of years ago.
I don't recall any models other than the ones i made. I could be
wrong?
Anyways the easiest way to show the difference between a
KW7, and a 102" whip, is to show jpg's of each antennas currents.
They are attached here.

You're going to put hundreds of watts into an amplifier designed for a 4 watt
input?

I didn't tell the guy it was impossible, just better to not try. It is easy
to do (with the right experience) maco,cci and a couple of other people
either used to or still sell these combiners, just as easy to build
yourself, as you told him, but probably not worth his time considering the
fact that guy would probably be lost if he had an imbalance.

Ben, I have read the other reply's to your post, but I have this same amp and used it with an Eagle Sidewinder 400 with 10 AM dead key. Smoked the finals twice. The tech I had work on it tuned it with a Cobra 142 @ 4watt AM dead key with no problems. Back on the Sidewinder and poof. I recommend no more than 4 watt deadkey. The little you give up in drive will save alot of headache. Also a side note, the Cobra amp isn't the same Cobra company that makes the amps. It is a fairly clean amp though, had lots of comments on the audio from it. Hope this helps, Marc

Ben Olson wrote:

> i was wondering if it would be semi-safe to put 25watts PEP to an HD linear, rated at 10watt deadkey input. i have no idea what the CB deadkeys, but it has a 1969 final in it, the unit in question is a Uniden PC66XL that has been really modified. and the amp i want to mate the 66 to is a Cobra 350XL from coaxkid (palomar blue face type, HD class AB1) anybody know if i would be safe to run this combo, or if i would kill it?

The maximum legal power on AM is 4 watts of RF output, not 16 watts
PEP. Read Part 95.

At least you have the correct figure for SSB power.

If you take a reading at the antenna, and then at the other end of the coax
it is very possible that you will see a different reading at each end. even
more so if your antenna is reactive.

Hi there,

  I`ve been looking around for a good deal on a handheld (or hand
held) CB radio. I can get the GE 3-5980 at around $25.00. Does anyone
have anything positive or negative to say about this radio? I`d like
to hear it VIA E-MAIL.

Or if you have a handheld unit for sale please
e-mail me.

Why would you have a ground plane if you made a dipole?

Just curious?

The Cobra network runs on Channel 34 USB.

I used to belong, years ago to their net... Good bunch of people.

San Diego Border Controllers run channel 6. They are the typical superpower
base and mobile stations. If you are into SSB, probably not your cup of
tea.

Very true.

Some kids seem to be better conductors than others, though!

I remember in High School (Santa Cruz, Ca), we had two girls wearing new (at that time) spandex type bathing suits...

Lightening struck the beach in front of them a couple feet away..

The lycra or spandex or whatever their suits where made of instantly melted away....

Leaving a couple nice naked bodies! ;-)

I have read part 95, and if you knew the difference between average power and peak envelope power (FNG -- Fucking New Guy... Must be a no-code tech), you would know that the peak power output of a 100 percent modulated AM carrier is nearly 16 watts!

I suggest that you go back and read some more of Gordon West's material..

Oh wait.... He only gives you enough to pass the test... Not enough to know what the hell you are talking about.

On a side note... (read this as mathematically proven):

4 watt carrier, for base reference..:

RMS power = 1
AVG = RMS*1.414
PEP = AVG*2.828
Therefore, PEP=3.998792*RMS

So, if we have a 4 watt carrier, you take that 4 watt carrier and plug it into the equation:

4 X 3.999 = 15.996 PEP watts
4 X 1.414 = 5.656 AVG watts
5.656 * 2.828 = 15.995 PEP watts.

See how that works out? The average heating power of a 100 percent modulated (sinusoidal, single tone) is only 5.656 watts. It is only 4 watts RMS, however, it is close (15.995) to the 16 watts that I mentioned above.

Hope this serves to pick up where Gordon left off...

These are simple formulas that a lot of the CB community knows, but for some reason, the Ham community doesn't...

Toll Free

p.s. I like how you don't use a real email address... What's up with that?

Ranger AR-3500

Freq Coverage: 20-30 mHz (and could have VCO work to go farther)
Power out 100 watts PEP (up to 150)
Modes AM, FM, SSB ,CW
Split freqs capable for repeater offset or DX

As a matter of fact, it does nearly everything my Kenwood does! Except
selectabel filters and dual VFOs.. (except for the split part)..

Funny.. It was a 300 dollar radio.....

Good deal in my book!

hi folks i live in Gwinnett county Ga would love to find someone who could
either raise
my antron 99 antenna or either put it high in one of my trees more than
happy to
pay of course if anyone is instrested please e-mail me and let me know
thanks

The pattern for the KW7 makes it look like its a voltage fed antenna.
That would make the feed point a fairly high impedance feed point.
Is it?

Toll, don't start this... there will be some people who still believe that it
starts in the clouds and comes down! I love it! Some of them will argue with
you till the sun comes back up.
<<<<<<<<<<>>>>>>>>>>>>>>

Actually, lightening does not take ANY path to ground.

Lightening starts at the ground and goes up!

Toll Free

I've had 5 KW-7's and 3 different vehicles. Without tuning them,
they all had an SWR of 1.5:1 or lower. I have used dual chain
bumper mounts, trunk lip mounts, a hole drilled in the bumper, and
now mine sticks out of the center of my trunk. SWR: 1.2:1. I can
talk from Baltimore to Belair or Annapolis barefoot on AM (when the
skip dies, early in the morning) I have skipped barefoot on AM.

I would doubt That would make the feed point a fairly high impedance
feed point. Not to be rude, just answering your question. I don't
have an MFJ-259. But I want one. As soon as I win the lottery or
make my first million <:

That's too bad about the 4 footer. I have a three foot one that I put on if I know
I have to use a garage to park. A wilson is better than the 3' and probably better
than the 4'. Just because my 3' has 1.1:1, it doesn't get out better then my 7'.

Can anyone give me some advise?

This might be a difficult question to answer via email, but here goes....

I have acquired a set of Browning Golden Eagle Mark III's (I'm guessing a receiver and transmitter) about 7 years ago. They have been sitting in boxes every since then. I also have the microphone for them. I am not a CB or ham radio person, so I know ABSOLUTELY NOTHING about how to work this collectible. Can you tell me how to test this equipment to make sure it is functioning correctly without using any test equipment? I do not have an antenna for it. I have not decided if I will keep the set or not, but I have found that they are worth a little money if working. That is the problem. I don't know if they are working.

I also have a rather large piece of equipment that I assume is an external amplifier of some sort. It has no name or identification markings on it. There are several unmarked dials on the front, and what appears to be an RF meter. There is a fan on the back and it looks like it connects to the antenna cable between the antenna and the transmitter. I don't know how else to explain it. Any ideas?

Thanks in advance for your help with this strange situation I am in.

Chris Poldervaart

Hello,

who has time to come?

Saturday, 6th November 1999 / Samstag 6. November

8th Rheintal Electronica (Radio and Electronics exhibition)
8. Rheintal Electronica 99 (Funk & Elektronikboerse)

Where/wo : Durmersheim (Germany, south of Karlsruhe
            (Baden-Wuerttemberg/Deutschland)

exact   : Haardt-Halle, Durmersheim
open   : 09h (CET/MEZ)
end   : 17h

How to find:
Autobahn "A5" Kassel - Frankfurt - Karlsruhe - Basel
use exit "Karlsruhe S�d / Rheinhafen" to Durmersheim, see signs

Funk-Einweisungen / Radio Assistance
CB-Radio : Ch. 15 FM (27135 kHz)
Amateur   : 145.500 MHz F3E

Free parking and free Bus-Transfer to the exhibition. Please follow the signs and directions.

Ausreichend kostenlose Parkplaetze mit kostenlosem Bustransfer zur Ausstellungshalle! Hinweis-Schilder beachten!

The Program:

Private Sale of
 -CB-Radio, Amateur-Radio, Accessoires
 -Computer, Software, Spare parts
Demonstrations
German CB-Radio Museum
Dealers show
Information of RegTP-Authority (like OFTEL UK, PAR PK, BAKOM CH)

Contributions and discussions (in german language)

Auf dem Programm:
- privater An- und Verkauf von
  CB-Funk und Amateurfunkgeraeten,
  Computer, Software, elektronische Bauteile und Zubehoer
- Vorfuehrungen
- Deutsches CB-Funkmuseum
- Haendler-Ausstellung
- Infostand des RegTP

- Vortraege und Referate
(vorlaeufig, Erweiterungen und Aenderungen moeglich)

* GPS und Funk-Applikationen (Dr. Karl H. Ilg (DK2WV))
* Gestaltung einer eigenen Homepage (Hans J�rgen Schlager)
* Der Weg zur Amateurfunk Klasse 3 (Martina Lohse)
* Vergangenheit und Zukunft des CB-Funks? (Henning Gajek)
* Packet-Radio auf CB-Funk - Ein Netz mit Zukunftsperspektiven?

Well, when you think about it, it make sense to use a 10 meter radio (2510, or 2950 type) on CB. With usually one simple mod, you get the whole band with a handy frequency display. Compare this with a bastardized CB with 5 switches to work the PLL for the extra channels, which often requires a frequency counter or at least a truth chart to operate. Band scanning with this arangement is difficult. The 10 meter radio usually has other options, like memory channels, which make the radio experience, all that much more convienient. Also, a modified "legal" CB typically will not cover 2 Mhz effectively without some power output and receiver sensitivity loss at the band edges. The 10 meter radio also has FM in it, which is a cool mode to use for local talking. Much better fidelity, if set up properly.

If you're sole purpose on CB is to run on channel 19 or do the keydown thing, then a simple Cobra 25 should suffice. If you're into more frequencies and other modes, then a 10 meter radio makes sense. Especially when you consider that the intial price of the radio is not much more than a legal CB, and the cost to have it "done up" by a local tech.

>
> Don't believe me? Why don't you call the FCC? They will tell you that a stock SBE Console II of 1976 vintage was very much legal to run at any modulation level since this radio was NOT required to be equipped with a modulation limiter.

I have no problem believing you, since many older 23 channel rigs had no limiters. But if memory serves me, the Console 2 had the same board in it as the Sidebander 2 and I know that THAT radio had a crude modulation limiter in it. It wasn't very effective if you "cranked up" the mike too far (It was more of a clipper, and sounded like pure trash if the mike was up too far, but you could overmodulate, but I can't imagine why anyone would want to sound like that). It worked ok with the supplied microphone. Many rigs of the day met FCC compliance with the stock mike, but when equipped with a power mike, the radios would overmodulate. Regardless of the status of the radio's internal circuits, you were still not allowed to exceed 100% modulation. One of the reason that CB radio have such elaborate modulation limiters today, is because people did not know how to properly set up a power mic. Now, with the factory limiter, you can't overmodulate, even with the mic cranked up. Another example of the FCC making "adjustments" to their type acceptance, to thwart illegal operation.

The bottom line here is that you were NEVER allowed to run over 100%. Older rigs did not protect themselves from people with big power mikes, but ultimately the station licensee was responsible for the spetral purity of their station. The fact that you knowingly were running in excess of 100%, makes it all the more illegal.

It's hard to preech the virtues of radio virginity, when you've got a few old skeletons in your closet. Doing so makes you a hypocrite, and undermines your credibility.

> this specific case.

I never specified RG-8. You are adding conditions.
But I'll make my case anyway with an example:

Since this is a CB newsgroup and the topic is regarding a mobile
installation, let's consider the coax that is most typical for a
mobile CB installation (makes sense, doesn't it?).
RG-58 cable has a loss of 2 db per 100 ft.

Measuring the SWR at the transmission line input requires
measuring forward power and measuring reflected power at that
point. The reflected power first traveled all the way up
the 18' cable before it was reflected. Then it traveled all
the way back down the 18' foot cable where it is measured.
The distance up and back totals 36'.
The attenuation to travel the entire distance is roughly 2/3 db.
This leaves about 86% of the total power that would have traveled up
and down an ideal, lossless cable.

Now, let's say you have an antenna that provides an SWR of 3:1.
At the antenna, you will measure an SWR of 3:1.
At this SWR, the reflected power is 25%.

At the transmission line feed point, the measured reflected
power is 86% of 25% (0.86 x 0.25 = 0.21) or 21%.
21% reflected power corresponds to an SWR of 2.72:1.
You will measure an SWR of 2.72:1 at the transmission line feedpoint.

Do you believe that 2.72:1 is the same as 3:1?

RG-8 has about half the loss of RG-58. It would read approximately 2.86:1 instead of 3:1.

Please read all of this post.

1. I have a WORKING Realistic TRC-458 which is a 40 channel CB base AM/SSB radio that I am selling for a freind. The radio is some scratches and a bit dirty, (belonged to a smoker). Has NEVER had any extra channels put in it.
Great radio, as it can do over 200 channels. Info on the net. It has the 858 chip.
Full service manual included (a $ 25.00 value)
Sell 1 and 2 for $ 75.00 plus shipping.
Picture avaliable ! ! !

2. A TRC-449 mobile CB radio (same board as the TRC-458) for parts.

3. A Radar Detector, manufactured in the 70s (working the last timre I used it, before the law changed).
Sell for $ 35.00 + shipping.
Picture avaliable ! ! !

4. A Kenwood KSC-4 battery charger (working) with service manual.

Sell for $ 25.00 + shipping.
Picture avaliable ! ! !

SAVE SAVE SAVE! ! ! !
I WILL ask $ 125.00 + shipping for ALL . Items sold as-is, radio
have no mike.

Please reply to email as I do not often get to this newsgroup. He
want to get this stuff sold ASAP, so please reply ASAP. I will reply
to you Monday to Friday only.

Thank-you,
Greg

You can buy a kilowatt amp that would pump that mother up!! Really what
you have for a antenna has more to do with range than wattage.

A fact in who's book? Changing the length of coax thats connected to
any antenna that not resonant or non-reactive does change the swr.
The SWR is constant alonng the length of the coax, but it does change
when you actually change the length of the coax.
Here's an example that you can use to prove your statement:

1. Folded monopole 150 ohm feed point fed with 1/2 wave of 50 ohm
coax. Whats the SWR?

2. Folded monopole 150 ohm feed point fed with 1/4 wave of 50 ohm
coax. Whats the SWR?

Thanks to info and help. Especially to Tony. I got the radio (Uniden 78ltw,
with K40 trunk mount) in and it is performing great. So far the car still
works also.

The original topic or what started the changing length of coax discussion was professors statement that changing the coax length on the coax feed to a 102" whip would cause " a slight variation" in swr. A 102" whip is not 50 ohms, so feeding with 50 ohms coax could very much cause a change in SWR with a change in coax length.

Are you implying that the standing waves will be different at various
points on the transmission line? Cable losses have nothing to do with
SWR readings...

Thanx. I am very intrested on the outcome but haven't gotten around to
getting the setup. Too busy buying other things.

I could never make such a blanket statement. Many factors affect the antenna impedance. If the antenna impedance were so cut and dried, no tuning would ever be required; they would all come factory tuned.

> so feeding with 50 ohms coax could very
> much cause a change in SWR with a change in coax length.

This is a non sequitur. It does not follow that the SWR will change with coax length. It simply does not. You keep parroting this but never make any good case for it. Give us an example.
You cannot.

Yes, but not a whole lot. Standing waves are the interaction of
the forward and reflected power. If the reflected power is
attenuated by coax losses, this interaction must change.

Cable losses do affect the SWR (again, not by a whole lot). I've
demonstrated this with an example above. If you disagree, tell me
what is wrong with the given example.

3:1

You have provided an example that supports my point. The SWR is
the same at both lengths of coax. Good one!

Why is it when one of my family members turns on the Nintendo 64 I get interference on my CB? I get about 7 s units of noise on the meter. The CB is not in the same room as the system. What would cause this to happen?

Your radio is expecting to see an impedance of 50 ohms from the antenna system. You key and send a signal down the coax to the antenna. If the length of the antenna is not correct, be it too long or too short, the radio will see an impedance higher or lower than 50 ohms. If the antenna is not resonant on the frequency, or is not seen as 50 ohms by the radio, a certain amount of the rf energy will be reflected back to the radio. The standing wave ratio is the ratio of forward power to reflected power, therefore a perfectly resonant antenna swr could be measured as 1:1. A less than perfectly tuned antenna could show a 2:1 swr, and a severely out of tune antenna might have a 4:1 swr.

Your Nintendo is a Part 15 device and generates some rf. It likely is
getting in on the electrical system. It is possible that the grounding
system is not adequate. You DO have a separate ground rod for your
radio, RIGHT?? See if they are on the same circuit and wrap both
electrical wires with toroids made from #43 material.

> works also.
>

In my Ford Windstar I found the antenna had to be run out the back of the car also or the noise was unbearable. I tried a Larson with a mount for inbetween the fender and hood and ran the coax through the fire wall. The noise was brutal. Second try with a Lil Wil mounted in the middle of the roof with the cable running through the car and out a window eliminated most of the noise. The radio is Uniden 76. Next vehicle will probably not be a Ford due to the noise probs.

>approximately 2.86:1 instead of 3:1.

Like i said "None to speak of."

Variations of a SWR reading skew much more than this with different
coax lengths on a typical mobile antenna installation. Those "skews"
are not attributable to coax losses.

Well I mounted a trunk mount K40. Ran the cable through the foldown back
seat. Haven't noticed any noise so far.

Don't see where I was putting down CB operators, as a CB operator myself, that'd be a pretty stupid thing to do. What I DID do was put down the only too visible and obnoxious stereotypical operator. Guess that includes you, my apologies. Sorry if the "foo shits."

>
>Now, let's go below and find out that you are a flipping idiot that is

I am perfectly capable of thinking for myself, and have held these same opinions for years before I even thought of getting my ham ticket. I've been a CB operator for over 22 years, so I think I've been around long enough to have been able to form my own opinions.

>Sure sounds to me like Roger Beeps are illegal

Which was my opinion. See, is says "sounds to me" which should indicated that I am voicing an OPINION as opposed to trying to represent the statement as fact.

>>>>Where?? Seems to me that if they where illegal, the two type accepted

Okay, so a single 1/2 second tone is acceptable. I don't have a problem with that either, provided said tone is properly modulated not to cause interference on adjacent channels. My objection to the so called roger beeps are the multi-beep sequences that one can hear 10 channels away and which go on for 3 to 5 seconds at a time. THESE are the tones I consider to be against the spirit of the regulation cited above, not a single short duration tone.

>
> If the signal is a subautible tone, it

But the multiple sequence tones ARE.

>The single tone roger beep is designed as a EOT (End Of Transmission) tone.

Doesn't explain why I have to listen to some idiot's radio playing "Dixie" across 10 channels when the ambient noise level is S1 or below.

>So, looks like you regurgitated something that you read, misinterpreted it,
>and should now feel like a total ass.

Actually, I was beginning to feel like you may be.

Shame, shame. An extra class ham call, and you are selling your old CB amp? You should do the right thing by it and bury it in the back yard, or apply enough voltage to it that the smoke comes out.

another good antenna is an inverted V.
it is like a dipole but is vertically polarized.
the only downside is that it also acts like a dipole in that it has strong radiation lobes at the broad sides and nulls at the ends.
if you wanted to, you could construct 2 of them. 1 in the north / south lobe and 1 in the east / west and switch between them for directionality but keep them as far apart as possible so as not to have an interaction problem between them.
take 103 inches of wire, 2 pieces for each antenna. connect 1 piece to the coax center conductor and 1 to the shield.
hang the end of the coax with the wires at the peak of the attic and secure the other ends of the wires at atleast a 45 degree angle toward the floor, hence an inverted V. you can either hang the rest of the coax down the middle of the V or along the shield leg of the antenna. DO NOT run it next to the center conductor leg as you will never get a match.
trim for best swr but trim BOTH wires EQUALLY about 1/4 inch at a time. it shouldn't need much trimming and check the swr at both ends of your band of choice and the center frequency.
this could be channels 1, 20, and 40 for cb or 26.515, 27.205, and 27.865 for a tri-band radio. this antenna is fairly broad-banded but don't expect miracles for much over 120 channels.
good luck.
jeff

i don't know your neighbor or his attitude but if you feel safe approaching him 1 on 1, you could tell him about the problem. he may not even know that the problem exists and may be willing to fix it, post haste.
if you don't feel safe with this route, look in the federal government listings in your phone book for the federal communications commision. there is usually a field office in most major cities.
if not, call long distance information to washington, dc and ask for the fcc.
it may take getting your neighbors involved in the complaint process to get any action because the fcc is, a lot of times, slow unless it involves a disturbance in public safety communications. you do have a right not to recieve interferance but the fcc's budget is a low one and it may take several trys to get action.
good luck,
jeff

that's no lie. if the rf police were to get out to some of these ham fests and walk around with us, if we spot a "cb" amp for sale and the seller were NOT a ham, they would probably run them out on a rail and if they were, they would either excuse the item as only for sale to a 10 meter op or ignore it all togeather.

this is my point when i say that they are so busy pointing fingers at the dust pile in our yard but won't turn around and look at the shit pile in their own yard.

they won't acknowledge the hams who do out-band cb conversions, scanner / cell mods or mars / cap mods on ham equipment WITHOUT benifit of a permit.

if you were to pull a surprise inspection in every hams house in america, i would bet everything i own that you would find as many equipment violations in those ham stations as you would find in cb stations.

maybe more because most hams, at least the ones that i've had face to face contact with, feel that they are above the law in an under-the-table way by virtue of their ticket.

hams generate, in my estemates 80 or 90% of private interferance complaints to the fcc because of their knoledge of the rules, where and how to use them and their communications comando attitude. in some cases this is a good thing but they also know that in cases such as radio mods, where they arn't actually causing interferance, their buddies won't turn them in.

Wonder if they use plate/collector modulation?
Most references I've read suggest that high-level
audio modulation of the plate or collector (or drain)
produces higher cleaner modulation than
low-level (base, grid, or gate modulation) modulation
does. Plate modulation sounds great!

If it was sold under the Radio Shack name, then why are you complaining? That means that either the Washington is a piece of crap because it was sold by Radio Shack or it's actually a good radio and your blanket statement that Radio Shack radios are no good is wrong. In case you haven't clued into it yet, Radio Shack doesn't make it's own radios. It gets other manufacturers to do it and they slap their name on it. DUH!

And yes, I do know a LITTLE about the CB radio "industry". I've been into the hobby for well over 10 years now and have had my share of different radios.

What? You mean having 2kw amps and 2 big coil antennas on top of their vans brandishing their "mudduck" handle on the side with some fancy airbrush picture doesn't give them that right? I thought it did. :)

Ever think of the possibility that the amps being sold were for HF bands, probably for the 10 meter ham band and your conspiracy filled little minds just saw them as an opportunity to use them for CB? Just because of the way an amp is made it can cover frequencies to include CB doesn't mean they are intending to sell them as such. It's not like you can make a 10 meter only amp...

thank you mister moderator, you are perfectly right. when i first came to this
ng, i enjoyed giving benifit of my experience.
although i am no rf guru, i have been around the block a few times and have
even tripped a few times here.
the sooner the rf police get off their high horses, the sooner that we can stop
dodging all of the shit that they drop all over this news group. and get back
to the business of cb radio.

HOLY SHIT!!!
```

now i'm shaking in my shoes.
so now i've got a pile of "new" amps and "used" amps or i've tested all of my
amps on a dummy load before shipment for my HYPOTHETICAL export business.
the fcc comes in and finds scratches on the antenna plugs and ASSUMES that i've
used them???
I WOULD SUE THE PAINT RIGHT OFF THEIR WALLS FOR SUCH AN ASSUMPTION IF IT WERE
TO MAKE IT AS FAR AS LEGAL ACTION!!!
you are the only person that i know of with an SO-239 for a left ear and a
large 50 ohm resistor plugged into his right ear.

now i can say it, YOU'RE FULL OF HORSESHIT!!!
technically it could run at any modulation setting but the higher you go past
100% the more sidebands / splatter you generate.
you dug the hole with the last 2 or 3 postings, you have a self-inflicted gun
shot wound in your left foot that is bleading from several arteries and you
have no one around here to help you.
you might as well lay down in the hole and die, deputy. we will all be glad to
kick the dirt in over you, re-lay the sod and piss on it to help it grow.

i love how these hit-and-run hams do this or do filters so that they can come
in here and yell an run before the echo comes back.
they're too chicken to listen when someone can document their screw-ups.
B.T.W. rfenforcer responded to something that i wrote earlier and made
references alluding to the possibility that i was the only one who objected to
his views on power, out-bands etc...
i told him that my posts must be the only ones that he reads. what are your
views and opinions on this.
PLEASE FEEL FREE TO E-MAIL ME AS MY MAIL BOX IS OPEN TO ALL.
thanks.
jeff

if rfenforcers shit gets any deeper, he'll drown in it and i can retire my pen
that is mighter than the ham ticket.
here is another credability damaging statement made by the rf police / ham who
is trying to hide under a license to cover up and justify HIS illegal
activities.
your badge has gone beyond tarnish this time, deputy. you've scratch off the
gold plaiting to reveal the lead that it's made of.

That is actually very impressive.  I am surprised that anyone noticed
since I have not been to this NG in awhile.  I moved out here in August
to hit the books again in graduate school.

>wanted to connect two amps together!

how in hell would you paralell 2 amps in a economical manner.
i have seen some set ups where people would have a radio set for high swing,
run into a dial-a-watt set at 4 watts similar to a modulator then run into a
much larger amp.
it was loud enough to hear in the fillings in your teeth for miles. :):):)

my personal definition of the word "nigger"
has NOTHING TO DO WITH RACE OR COLOR.
if you match my defination of "nigger" your color will NOT be an issue.
you are a nigger REGARDLESS OF YOUR SKIN TONE IF:
1) you think that you, as a human being, are better than me. i will not be a hypocrite and say i'm better than you.
you may know more or less than i do but that doesn't make one better than the other.
2) you presume to tell me, without authority, what to do with my life or personal property. if you do, then i will procede to resist, difie or tell you exactly what you can do with your self-ordained authority.
3)if you are a holier than thou type, that't automatic. none of us are perfect.
i chose the word nigger for this because it is a terible word and has been mis-used for much too long against one segment of the population of this planet and it needed a more balanced, generalized target area to give other races the opportunity to feel the "joy" of hearing "HEY NIGGER" directed at them on a more deserving, more level playing field.

>http://auctions.yahoo.com/auction/8946230. This gentleman is selling a
>2-meter
>mobile rig. In the description, he offers the following notice:
>
>"When you bid on the rig, please e-mail me w/ your callsign so that I can
>verify you are a ham. It is illegal to sell a ham radio to someone who is not
>licensed. "
>
>Nope. Guess again. Better go back to your Gordon West books.

that depends, did he give an address in the U.S.A.? according to your post,
this entry came from a yahoo site which i believe is in the U.K. somewhere.
laws do vary from country to country and it may be a serious issue where he
lives.
it's like our movie titles sound good to us but translated into other languages
sound funny or senseless.
another example was the chevy nova. it didn't sell well in hispanic countries.
when chevy checked into the problem, the found out that nova loosely translated
into spanish was doesn't work. chevy seems to have had several problems with

this.
i knew a girl in high school years ago who was from Hungary. when she over-heard
one of the guys talking about "blowing up my vega last week", she began to
laugh hysterically. it seems vega in hungarian is another word for penis and
the vision of the guy "blowing up his vega" was more than she could stand.

US, what do you mean US???
you have the balls to come in here and tell US how bad we are like some kind of channel-master and then you have another set of bigger balls to say "he can't stand being away from US."???
you are tripping over your 4 big brass balls and those 2 self-inflicted gunshot wounds in your feet now. for your own safety, you really should sit down..........
ON A NORTH BOUND EXPRESS TRAIN!!!

this is true but YOU should stay on the subject.
if the post says "how do i put channels in my XYZ radio" and i answer "do it like this" and you come back and say "you're wrong, do it like that", THAT is a differing opinion ON subject.
instead you come back with your bullshit about the legalities which is NOT in the question at hand which is akin to spam.
if i were to post the question, "what color is an orange?" your reply would probably be "chevrolet". get my drift now? the answer is compleatly off from the subject of the question.
if you want to post your opinions about illegal operations or fcc regs, FEEL FREE to do so. just press the new message button instead of the reply button.
that would be all it would take to end this war. instead of using the reply button like a launch button, use the new message button as a forum / dialog button.

>You're in a public forum. You should get used to hearing

>>"Toll Free" is absolutly correct on these two points. Believe it or
>>not, I have received responses by "freebanders" to my CQs on 10m in the

does this mean that his ham radio was splattering into the out-bands?
if they were in the out-bands and heard his cq, this must be so.

>I have encountered and confronted this type of operator. Their attitude is
>typically much different than those found around 28.000-28.100. Whereas the
>"encroacher" will usually aploogize, say "I didn't know", and move back below
>28Mhz when asked politely,

if the encroacher is in the 28.000-28.100 code portion of the band, what are
you doing there TALKING to him on voice???
unless there is a threat to life or property, there is no variation that i know
of from fcc rules that allow you to use voice on this portion of the band. YOU
HAVE ALSO BROKEN THE LAW!!!
if you say that the fcc would look the other way in such a case, it would be
tantamount to saying that the fcc breaks it's own rules too.
to get the out-banders off from ham freqs requires a certain protocol. hunt
them down, find them, turn them in to the fcc.
in stead you took the law into your own hands, deputy, and in the process broke
the law yourself by using voice on the code portion of the band. turn in your
badge!!!
SHAME, SHAME, SHAME ON YOU!!!
i hope you had your bb gun in hand this time.

.>Hams effectively do this. Will you accept the challange?
>
you are compairing apples to oranges.
hams give their numbers every 10 because of fcc rules and anyone who cares to
pick up a book can find your phone number.
if i were to post my phone number on the air, anyone with a general coverage
reciever could come harass or endanger my family at any time.
there is a reason my phone number is unlisted. i like my privacy. if i were to
get a ham ticket, my privacy would go out the window. i believe that the fcc
would have the right to that info, but to post it in a book that anyone can buy
is just plain stupid in my opinion.
you were stupid to even suggest it.

>> DON'T YOU THINK WE ALREADY KNOW THIS???

you must be the moron. why would people come here for this info if they thought they could find it elsewhere???
i've said it before and i'll say it again:
if you want to post your opinions on the legalities or the fcc regs, post it as a NEW MESSAGE instead of spamming the questioner with all of this bullshit!!!
if you all were to take turns posting this info once a day under a banner headline like "CAUTION" or "READ THIS!!!" or "RIGHTS AND RESPONSIBILITIES OF LEGAL CB OPERATION", then it would be always posted high on the list, prominently for all,WHO CARE, to read. that way, we could end this war in a way for all to be satisfied. you and your ilk can disseminate your message and i and my ilk can get back to taking care of OUR own business.
no one yet has answered my original question:
who gave you or anyone outside the fcc the authority to tell me or anyone what to do or not do on a NON-HAM BAND?
just because it's against the rules does NOT make it your business.
if i were to follow you around everywhere you drove and stopped every where you stopped and told you in public or private about EVERY traffic law that you may have violated, you would be right up my ass, just as i'm up anybody who plays rf police, TO MIND MY OWN BUSINESS!!!
wouldn't you? if you say no, i'll call you a liar.

>If you don't like the thread, just go on to
>something else.

this is what i've been telling the rf police for months now. if you don't like what you see, don't spam an answer, just pass it up!!!
if you pass up the "illegal" questions, i won't spam any NEW postings about fcc regs or ham opinions on the subject.
DEAL???
let me know if you agree. if you do ,try to reign in some of your ham friends to sign the "peace treaty".

>The
>intent of most informational posts is to be====informational.

only if this were true but if you read most of such posts, you'll find a bunch of whining, preaching, smart ass remarks, or smart ass references to other members of this news group in an attempt to make others look bad. i will give you some offenseive examples:>You must be a moron
>put a cork in it and go on.
> your dumb-ass actions.
>
i rest my case. yes i too resort to stiff language but only in self defense.
so, dumbass, why don't you stick a cork in it and go on before i have to make a fool out of you again. your words in this thread arn't very convincing of a ham who is trying to sell people on the brotherhood of the ham community.
if you were an asshole salesman, i wouldn't buy one from you if you had the last one that i needed.

>communications law. We're so proud of you.
>

you finally shot your dick off this time, didn't you. i told you to use a bb
gun but no, you had to use a mouth full of buck shot.
what am i talking about, you ask???
right here:> federal communications law.
NO SUCH THING DEPUTY!!! TURN IN YOUR BADGE BOY, YOU'RE FIRED!!!
the federal communications commision NEVER makes laws. that is the job of
congress. this is why the fcc CAN NOT charge you with a crime NOR FINE you any
money. they CAN send you a notice of aparent liability and take a FORFITURE
action against you so this moral crusade that you claim that you and the other
RF police are on against "illegal equipment and operators" and" breaking the
law" and "is it right to support law breakers on this news group?" doesn't hold
water.
please be more careful in the future what words and phrases that you try to use
to intimidate and convince people that you know what you are talking about.
it is becoming more and more apparent that you actually DON'T know what you are
talking about and it is looking sader and sader for you all of the time as the
waters clairify themselves.
the name rfenforcer is also ringing more and more hollow all of the time as
your golden paint is chipping away to reveal the lead that is cast underneath.
good luck with the new name when it comes.

Hello Gary: Good to see your nit picking unfriendly ways extent to everyone. You sure are spring loaded to whine. This amp the gentleman has advertised, is a collectors item, and not a usable amp.

Have you offered any help to all the rec.radio.cb people into the ham radio world?

You have probably run a bunch off, I'll bet. Your whining, unfriendly ways, and semi technical correct advice is entertainment, I look forward to your posts.

Jay in the Mojave

I've never seen a "legal" galaxy radio with a roger beep in it. Most Galaxies are exports. I'd like to see the FCC ID number on any radio proporting itself to be "legal" with a roger beep in it. I really think the FCC is slipping if they allow things like this. What's next, legal radios with built-in echo boards?

> >>>>And a single tone beep (which the FCC has already ruled as being legal,

The reason why you hear these roger beeps 10 channels away is because he same people that think roger beeps are so "cool", also tend to be the ones that clip limiters. A roger beep will drive the modulation output to an almost perfect squarewave, which will splatter like hell, unless the limiters are intact.

> >>

> >>>>>So, the single tone roger beep is not for
> >
> >a. Music
> >b. Whistling
> >c. Sound effects
> >d. Entertainment.

I'd venture to say that the MAJORITY of operators that use roger beeps in my area, do not do it to facilitate communications. They do it because THEY THINK it sounds cool. THAT, to me, falls under entertainment, or amusement.

>
>   But the multiple sequence tones ARE.
>
> >The single tone roger beep is designed as a EOT (End Of Transmission) tone.
> >And, the FCC (once again, I must continue to reiterate this.. . Seems that
> >drilling is the only way to get something in your head) has ruled that they
> >are legal!

If the tone is uses as defined to signal endo of transmission, on SSB, where there is no carrier to signal a station has unkeyed, then yes, I'd believe that its use would be legal. Ironically, most SSBers dispise noise makers, so they tend to avoid roger beeps. There is no need to use an end-of-transmission tone on AM where there is a steady carrier to signal when someone ends his transmission. The use of a roger beep on AM is superflouous.

And this applies to single tones only. The minute you go the "musical" note route, you have crossed the line from (Questionable) useful tool to entertainment device, and that is CLEARLY illegal.

Since legalities have little meaning on CB radio, the fact remains that roger beeps are damned annoying to anyone that is not anamored with them. Same with echo's. These "noise toys" are nothing more than radio billboards advertizing the operator "Look how cool I am, don't you wish you were me", and usually the total opposite is the case. I tend to avoid people that use radio to make a statement. I just want to talk to people, and not have to listen to their toys.

>HAH!!! ANOTHER HAM WHO THINKS HE'S SO SUPIRIOR TO EVERYONE ELSE. ARE WE SUPPOSED TO BE YOUR UNWASHED MASSES HANGING ON YOUR WORDS??? I THINK NOT!!!<<

First of all, Jeff, I guess it hasn't gotten to you yet that it is grossly discourteous to reply in all caps unless you are really trying to be belligerent.

In which case you are.

Secondly, in the forgoing matter, it is only incidental that I have a Ham license. The fact of the matter is that the material to which I was responding was technically flawed.

One of the biggest rifts between the Amateur and Citizens Band services is that there is an entire subculture within CB that is trying to reinvent RF technology and propagation. Much like Orson Well's book, "1984", it creates a garbled communication of "doublespeak"

I don't think I am superior to ANY one, yourself included. But I also am not about to kowtow to someone who is either blatantly trying to hogwash otherwise unknowing persons about basic RF practices, or is himself unaware and is trying to bluff his way through it.

Hey Jay, long time, no hear. CB is being destroyed by nits who somehow think they can do anything on the radio without regard to others. Amplifiers are the biggie here, because many of these guys can talk a lot farther than they can hear and as a result, they are trashing the channels for everyone else. Never mind that they claim otherwise. Chaulk it up to ignorance. My advice to operators is accurate and well based. Unlike some folks here, if I don't have some good advice for a problem, I try to keep my mouth shut. Wish you and others could do the same. I'm glad you are entertained by my words of wisdom to the newbies. At least I provide

advice to problems. If you did the same, you might have a better reputation.
Just, please, don't tell new guys it is just OK to buy and use an amp in their
truck.....it isn't OK.

Jeff, I'll be happy to tell you. Every CB operator on the band has the responsibility for behaving properly and for not deliberately causing interference to other stations. Your responsibility is to operate within the rules and laws which regulate CB, whether you agree with them or not, whether you like them or not. Nobody gives a rat's ass if you like it or not. If you or anyone else is to use CB, you are to exercise due diligence to operate properly. CB is already sufficiently congested without high power and noise makers. If you need someone to hold your hand so that you can follow the rules, I have immense pity for you. You never grew up. Your mommy is still holding your hand. Boo.

As usual, you have wandered into territory you know nothing about and shot your mouth off.

The FCC has no problem with hams making a simple, short announcement which states something to the effect of "this frequency is reserved for the exclusive use of licensed amateur operators" or something of similar content.

I'm not going to argue this point with you any further. If you want a second opinion, call or write the FCC and ask them yourself.

Better start saving your quarters for a good attorney, Jeff. Running that amp into a dummy load is still transmitting--it just doesn't go very far.

In an 8 hour period last night, Pllo2A posted 33 messages. If he had any
sense, he would have been on the radio instead. Late at night, the bands
are pretty usable.

Maybe he IS on the radio? Many people can multitask. It only takes seconds to write a 200 word reply to a thread. How many lulls in radio communication are there in your area? If people have a hard time listening to motormouths then they shouldn't be on the radio as most of the operators I hear are motormouths who never shut up. From the Hams I have seen posting on this group they have the same problem to a greater degree.

I have an old "Ringo " type antenna and installed it without running a
ground. Other then the obvious safety reasons will grounding it improve
SWR, range , ect? Also I have a mobile 50 watt linear amp. Can I use it
with my base with a power supply . Any advice or how to information
would be appreciated. Please don't lump me in with the majority of Webtv
users , who act like idiots, by flaming me or ignoring my post . Thanks
Tom

I have spoken to engineers at two monintoring stations and the FCC does
not care if you use voice on the cw portion of the band to warn
unlicensed operators.

That guy's obviously not smart enough to operate a radio. He could probably
figure out how to key the mike, but he'd have a real problem trying to figure
out how to plug the cord into the outlet.

I would like to purchase a second hand cb for my lorry, but i haven't a clue where the best place would be. I know nothing at all about cb radios, i've been told i need a "voltage dropper" ?, "mag mount" ?, and "unit" ?, could some one give me advice on how much i should be looking to pay, and maybe some guidlines on where i can find out some basics in laymens terms.

All help will be appreciated,

Thanks,
Regards, GEEBEE.........(East Midlands)

OK... get ready.

Ladies and Gentlemen.... Load your cannons.

This Sunday:
12:00 - 14:00 GMT Kp465 Doug in England
16:00 - 18:00 GMT Kp2o3 Peter in Florida

NEXT Sunday (10 Oct.) Kp 37 Francis... French Guiana

The Net Frequency will be 27.580 USB.

In the event that 27.580 is not usable, please check .590 or 570.

Hopefully, good conditions will prevail.

The Net will need your support, so if at all possible, please try to check in.

Remember, the NET period is 9 consecutive Sundays, so If you can't attend this Sunday, you can listen in ANY Sunday until November 28th

----
For up to the minute information about the Net, click the line below.
http://www.gate.net/~kp/Pg.Net.Page.htm

Or, simply go to the Kp Web Site.

http://www.gate.net/~kp (click the International Net button)

Please be reminded that QSP check-ins ARE allowed, however, use of the Internet is NOT allowed. You must make direct or indirect contact with the controller by

RADIO.

Have a nice day... Hope to hear you soon.

If I install a 2000 watt amp inline on my cb that works perfectly fine but
throw the microphone in the trash and just use the 2000 watt amp because it
has a good preamp and I enjoy listening, is this illegal? This is assuming
that there is not a single microphone in the whole house.

I'm going to purchase a tx-400 amp from my girlfriend's dad.....the
problem is I don't know how many amps this amp draws and how many is too
many before having to get a higher amperage alternator? Can someone
help? I had a palomar 225 in there at one time, and it worked good, but
that's a totally different story seeing how it's only about 175 watts
and doesn't draw much amperage...
Thanks,
Jack

if you have a ham liscence with HF privilages(assuming its an HF amp and radio)
than its not illegal.

And do you belive everything that the goverment tells you? I am a really good friend with a "local enforcer", that builds AC mobiles in upward of 5 kw's for the local trash talkers.

I told some of the Ch6 operators at the Chicago keydown that I could
'read their mail' here in the UK when conditions allow.

Unlike any other CH, including 19, when conditions are running and
someone strong keys up on your side the Ch is 'fully quieting'. It's as
if they're sitting in the passenger seat of my mobile having a cup of
coffee.

Like you, there is a language barrier:-)

>>and I think the skywalker 1000 is just 2 500s.
>>
>>
>
>Yeah its 2 500`s but not one 500 driving another 500!!!!...They are combined
>together.thats like saying an 8 pill is the same as just running one 4 pill
>into another 4 pill!
The big Skywalker is in fact made up with 2-pill modules. Four of them
to give you the 1200w amp.

If you have a good quality soldering iron, can use it properly and can read English anyone can build one.

If anyone on the group wants to build an amp and pretty much fully understand how it works afterwards, then I can recommend getting one of Lee's kits.

I have no connection, but have had several and still run his 8-pill.

No circuits included, The build manual explains everything. it's his manual that sells the amp!

Phil,

There is a way to run two identical amplifiers simultaneously............
If you are interested, email me and I will be glad to talk to you about it!

Jack

Yes but just turn down the mic gain if you have any complaints.
If you don't like that, then you could try to replace tr-24 and then
remove r 131

Hi,

I would like to know the uses of a 40 channel CB Transceiver. And also what exactly this device is. I believe it is a 2-way communication system. Does this also behave as a radio? Just curious to know if it can be used in emergency (say..if you are trapped in a car in snow...).

I understand that one can't dump 10 pages of text in here...so, if I can get a web site which answers my questions...it would be helpful. But, if you can answer to the point...cool.

Thanks,
Vathsan.

If you don't like CB get a Ham ticket. It's that simple. I will admit about a year ago I was very close to getting my own ticket. I even learned Smoke Signals...err, Morse Code. I got a receiver and an old 2-meter walkie talkie and I listened. Guess what. They do the same things on the amateur bands as what goes on CB. Don't think for a minute that "Big Strappers" are only on CB. I heard "Ray" (I forgot his callsign) in the NV/CA/AZ area key his station Friday night and, the damn thing had four loud relays on it! What's up with that? A week ago on 2-meters These two fools were fighting because one guy damaged the others equipment by causing it to stay keyed longer than it could handle. Nice. I fact, I thought it was kind of funny. Speaking of funny, 2-meter should be high on the list of things in need of repair. True insanity. This is a job for......THE RF POLICE! (How do all of them change into their spandex in one phone booth at the same time?). Anyway, someone will come along, armed with a callsign and all your personal info (which is posted all over the internet) and theaten the individual some sort of "I'll tell on you" statement. Not exactly what I had in mind. Some of these people would rather whine and cry about the same thing over and over again. The mentality is truly sad when you have to run and tell Mommy when things don't go your way.

No, they are not completely seperate.

If you have a slice of coax that is acting as a transformer, then you never
know the true feedpoint impedance.

I HAVE seen cases where you had a reactive load, and a specific length of coax would make it look like their was a true resistive load at the other end...

Tell me how their are two different things.

You are approaching the worthless category. Have a nice day. Since you ahve continued to prove that you don't know what you are talking about, and have no inclination to learn (I do this by real world installations, common knowledge, and simple textbook theory), I refuse to battle with you any longer.

You keep going on in life thinking that the .01 ohm resistance in a piece of coax is going to change your SWR.....

The rest of the broadcast community knows it doesn't!

No Kidding?! So, where do I connect my linear on my Pioneer? How do I tune in
Q-102 on my trusty Cobra? Is there another channel mod I'm not aware of?? I'm
glad there are such helpful people as yourself to help me figure these things
out!! Thanks in advance Stanley.

I found a mod that is supposed to let you talk
between 24 to 35, and listen all the way down to
2 meter. I haven't tried it yet but I'll let you
know.

     It's nice to see that Gary seems to deem Jay in the
same league as "THE BIG BOYS" I rarely see him post on anything
other than antenna subjects or interference or something along those
lines. I don't think I've ever seen any post on "How to get
that big linear" or "Go buy a linear, you'll get out better"
    Virtually all his post pertain to antenna situations, and being
that is the most important part of the system, anyway you can
```

make that perform better is good by me and probably most people.

What does it matter, you can't sell that radio now, because it
is not type accepted anymore............

Yep, and the model of that radio was TRC-490. The same basic chassis as
the Uniden MB8719 radios.

Many Radio Shack radios were made by Uniden. I used to get a kick out of
some "radio-know-it-all" giving some guy the dirt about his "crappy"
radio shack radio, while talking on his "wonderful" Cobra. All the while
they were both the exact same radio in a different case. Some people are
so easily swayed by marketing hype.......

Ok, I'm now one of the informed. Roger beep aside, how does it get FCC
approval with variable wattage? Who's paying off who here?

>
> They only do 40 channels, with the RCI MB8719 chip in them.

But easily convertable with that chip.

Yes, it is my opinion, but an opinion based on accurate observation.
When guys are talking around town, on AM, with > +10 over S9 signals,
there's no "need" for a beep. Therfore they are using it purely for the
"amusement" factor.

>
> Don't work much international sub 1 s unit DX do you?

Nope, I burned out of DX after running it in the late 70's (I did it
once, there's no challange to do it again). Today, I prefer roundtable
conversations with locals that I know. But if you are truly into weak
signal SSB dx, then and only then, is a beep tone justified.

>
> There is no need to use

> Don't work much weak signal DX on AM, do you?

I have NEVER worked a signal on AM where I can copy their modulation,
but be so weak that I can't distinguish when their carrier drops. If I
can't "hear" their carrier, I can't hear their modulation either. I

don't try to carry on a conversation with someone when I can only hear every other word or so. That is an exercise in frustration. I'll wait until they get closer, or the conditions improve, (or they throw a few more logs on the fire).

> The use of a roger beep on AM
> > is superflouous.
>
> See my comment above. They can be useful their, also.

I'll agree about their usefullness on weak signal SSB, but I don't buy it for AM, for the reasons stated above.

> > Since legalities have little meaning on CB radio, the fact remains that
> > roger beeps are damned annoying to anyone that is not enamored with

> like....

No, read my statement carefully. It is a statement of fact. If you like roger beeps, then you don't mind hearing them. If you don't like them, then they annoy you. If a little consideration and courtesy were a little more prevelent, then those people that have those beeps would restrict their usage to those (relatively few) times when they could be considered useful.

I have local who runs his roger beep all the time, until he hears me. He knows that I don't like hearing them, so he turns it off for me. While I appreciate his gesture of courtesy toward me, I've never heard anyone else ask for him to turn it on, so why run it at all? If it bothers me (and I'm very frank about what bothers me) it must bother other people, many of whom are not as forthright as I am. They would probably be more toleable if they weren't so darned loud. You try to set a comfortable volume, for people's voices, and the beeps are much louder. I've already woke up my wife late at night because the beeps travel though rooms, even though I had the volume down low.

A properly adjusted speech compressor will acomplish the same thing, without making you sound like you're talking in a tunnel. If people were REALLY concerned about enhancing their copyability, then they wouldn't run their echos up so high so as to make them harder to understand. No, I'll stick with my thoughts on their "value" only as a "toy".

TR 24 is the common "shunt limiter" for both the AM and SSB circuits.
Removing TR 24 is a bad idea, since it leaves you with no control for
SSB power or AM modulation.

I prefer leaving the limiter in and adjusting the AMC and ALC pots for
optimal modulation without distortion.

THe 2950 is a pretty good choice for a 10 meter-type radio. The latest
versions have overcome earlier problems with the microprocessor resets,

and short backup battery life. There were also problems with solder joints on the regulators.

That being said, the radio performs well. The receiver sensitivity is very good, and uses varactor tuning to track through the full frequency range. The adjacent channel selectivity is not as good as some other radios, but if you aren't in a major "bleed city" metro area, this may not be a problem. The noise blanker leaves a bit to be desired, and may have been improved in later models. I own an 8 year old version, and it has been fairly reliable. The only time it quit was for the aforementioned cold solder joint problem. A touch of some new solder and it was good as new.

Feature wise, I prefer the 2950 over other 10 meter radios. Performance wise, I prefer a Uniden HR-2510.

Tandy and Scan Shack Update: 07 OCT 99

----------) UPDATE (------------

Hello all;

To keep the thread to a minimum I have provided an up to the minute update on this whole issue.

As the creator of several scanning related sites, mailing lists and articles I have been sought out by friends, associates and users of my resources. In an effort to provide factual information I contacted Mrs. Angle of Tandy Legal the purported author and sender of the email to the Scan Shack which disclosed the alleged misuse of the word "shack" the provision of "unauthorized modification information"which was viewed by Tandy as a dedicated and major purpose of said site and Tandy Companies possible action should the site remain so named and so oriented.

On Wednesday, October 6, 1999, a call was made to Mrs. Angle and a followup

call later made to confirm her receipt of the alleged email sent by her on Tandy's behalf.
Mrs. Angle initially stated that "email could be faked and without it she was unable to comment."

Subsequent calls to Tandy Legal and Media Relations went unreturned Wednesday.

This morning another call was made to Mrs. Angle who immediately stated that Media Relations would provide any further details regarding the matter at hand, regardless of her earlier agreement to provide confirmation or denial of the alleged email and the subject thereof.

The call was transferred to Media Relations where the Manager, Mr. Tony Magollas who was unavailable but would be returning my calls in response to the Scan Shack issue.

In contact with the operator of the operator of the Scan Shack it appears that he believes the email was in fact sent from Tandy and has already taken the site off AOL in expectation of legal action by Tandy, he expressed the sentiment that the work required to remove, update and reinstall the site was in his opinion better than facing the Tandy Company in a legal battle over the semantics of his sites name and content.

As we provide these details we are awaiting comment from the Media Relations Department of Tandy Company in Texas.

When statements are issued from Tandy and confirmed they will be posted to the ScanPB site, newslist and here.

In this time we can only hope that users will contain emotions and await factual information which can then be processed in an appropriate manner.

Please stay tuned for further information and updates.

Thank you,

Bill Ames;

Creator ScanPB

I just bought one of the new uniden grant lt model radio's..does anybody know were i can find mods for this rig???i havnt opened it yet so im not sure if it is the same board as the old grant (although i suspect not since it has new features) any info/help will be greatly appreciated...thanx   73

ps-what are some opinions on this radio??is it any good?

I was wondering if anyone else has come across this problem.  I have a
Wilson 1000 trunk lip mount antenna on my 1998 Ford Crown Victoria.
When I hooked up the SWR meter I couldn't get anything better than a 3.
I took it to the radio shop and the tech there told me to push on the
trunk lid.  When I did the SWR when down to where it should be right
around 1.  I've tried just about everything to get a good ground with
this set up but it is really frustrating everytime I hit a bump my
ground connection cut out.  Has anyone else overcome this obstacle?

Thanks

it's the rf police, they're delusional in thinking that they can come in here
and tell everyone what to do.
i've asked them over and over again who or what gave them the authority to
order people around and in the past 5 months, i got 1 answer last night.
the e-mailer said society has the right.
i told him he was full of shit and didn't even bother to ask him what society
he lived in. it doesn't sound like any american society to me. i dismissed that
one as being crazier than a shit house rat anyway. he must be if that's the
best that he can scratch out of the bottom of his shit barrel.

Sure you can. If you know the transmission line parameters, you can
calculate the true feedpoint impedance.

I'm looking at the SWR curves versus coax loss in Chapter 16 of the
ARRL Handbook that George referenced. It agrees with what he says.
How do you explain that?

> Toll Free

You're under arrest for propagating myths about coax length and
transmission lines. Report immediately for your paddy-whacks and ridicule.

Amplitude Modulation (AM)
Amplitude Modulation occurs when a voice signal's varying voltage is applied to a carrier frequency. The carrier frequency's amplitude changes in accordance with the modulated voice signal, while the carrier's frequency does not change.

When combined the resultant AM signal consists of the carrier frequency, plus UPPER and LOWER sidebands. This is known as Double Sideband - Amplitude Modulation (DSB-AM), or more commonly referred to as plain AM.

The carrier frequency may be suppressed or transmitted at a relatively low level. This requires that the carrier frequency be generated, or otherwise derived, at the receiving site for demultiplexing. This type of transmission is known as Double Sideband - Suppressed Carrier (DSB-SC).

first point, you and rfenforcer really need to get out of preschool and stop
making references to peoples mothers. if mine is holding my hand, it's by long
distance from heaven so if you can't debate 1 on 1, get out of the business.
second point, i don't use or support noise toys or roger beeps. the only radio
that i have with a roger beep is my 2510 which came with it and it stays off so
don't try to hang shit on me to cloud the issue.
third point, i have seen NO laws written for cb, only RULES so get your
mis-information straight before you start to spread it around.
forth point, you and the rf police seem to give a BIG RATS ASS wether we like
the RULES or not or we wouldn't be having this conversation right now, would
we.
so again, get your shit straight.
fifth point, while you're looking at the dust pile in my yard, look over in
rfenforcers yard and recite part 95 to him when you read his post about how he
claimed to have caused interference and damage some time back with a 1976 model
radio which had NO MODULATION LIMIT and claimed it was LEGAL when he swung his

beam right at his neighbors house and cranked up his d104 mic.in return for a complaint that his neighbor confronted him with. he tried to hide behind his cb lic. at the time by saying it was LEGAL because he had a lic. although he was DELIBERATLY causing interference by his own admission. even if the radio wasn't designed with a mod limit, he was still required to keep it under 100%. if he had, he would not have caused said interference. go get a shovel and dump truck and clean up his yard and your brain, (teaspoon for that), before you bitch about my yard.

sixth point, i never said that i condone interference on the cb band. again, you're trying to hang shit on me but it just drops of and back on to your shoes.

you act as though i get on the cb and use no manners or protocol of any kind. your shit is showing again. you've NEVER heard one of my transmissions so your credibility is dying of tounge cancer.

seventh point, as for your exortation about the rules and responsibilities of cb use, i have to concede that you are right. they do exist, BUT you still haven't answered my question yet.

my question to you Gary Danaher is who are YOU and from what authority in the constitution or any other legal document, do you derive the RIGHT to tell me / us what to do / not do with our lives or property???

the only right that you have in this whole matter is to go to the fcc and lodge a complaint against me / us and let them do their job. just be sure that you have suficent evidence though or you may find your self in court for malicious prosecution.

eighth point, as for the boo at the end of your post. the only ones crying here are the rf police and like minded hams. we arn't crying about you and your activities. we are the ones the are holding the crying towels and baby bottles for you. so take a nap, you'll feel better in a few hours.

or did i mis-understand the meaning? was that boo meant to scare me?

the only way that a pussy like you could scare me is if you pulled up to my door with a tank, but then you had better take your best shot. it's the only one that you'll get.

jeff

>If you don't like CB get a Ham ticket.

i didn't like the shit attitudes of the stuck up hams so i started collecting cb's, (54 in all,41 modified). if the rf police arn't careful, i'll find out where they live and sell off my collection for $1.00 each to their neighbors. they are all clean radios but i can fix that. a great sacrifice to me but well worth it.

>This is a job for......THE RF POLICE! (How do all of them change
>into their spandex in one phone booth at the same time?). Anyway,

they don't, the fcc controls telephone service and had made this practice against the rules. and they would NEVER break the coveted rule bible.
so that they can be always vigalant, they wear their spandex and panty hose under their tu tu's all of the time always ready to save us from the evil RADIO PHREQ who turns up his output up to an ear-splitting 4.5 watts and his nasty sidekick MIKE who runs 101% modulation, (ON THE OTHER SIDE OF THE COUNTRY FROM THEIR GUANO FILLED BAT CAVE).

gee, i'll have to see that in the rule book.
if it's not there, then this transmission is still technically against the rules which means the original statement still stands.
after all we ARE talking about the technicalities of the rule book, arn't we???
or are you just giving up?

How nice of you to offer help.

Tom,

The Ringo Ranger should be operated with a ground, as it is a shorted antenna.

It may give you a slight change in bandwith / SWR, but that would also depend on the installation.

It WILL give you better range in that the static level may be reduced by proper grounding, as well as help to kill some bleed problems.

Also, try wrapping 8 to 10 turns of coax in a 12 inch circle immediately below the feedpoint of the antenna..... This will serve to act as an RF choke and help with reducing the common mode currents on the outside of the coax.

As to your linear, an AM radio with a 50 watt amplifier should run fine on a 10 amp power supply.

For an SSB radio, I would use no less than a 15 amp supply.... And a 15 amp supply would be better for the AM only scenario... Just thought I would give you worst case and better case.

Hope this helps.

I don't know whay so many people are worried about removing TR24 in a
Grant/148.

Here's the big secret that (I guess) nobody knows: Start with the
mic gain (dynamike on Cobras) set to center slot (that means the
slot or dot on the knob points straight up). Then, if you need
more or less audio you adjust accordingly. How tough is that?!

Forget the resistors, forget R131, forget the "modulation" kits, just remove TR24 and learn how to CONTROL the mic gain from the radio's front panel. Grants and 148s have been around for over 20 years. In that time, removing TR24 has ALWAYS been the most common mod because it gives control of the mic gain to the operator in ALL modes. In the old days, being an "operator" meant just that; the person knew how to OPERATE a modified radio. That means not running the mic gain wide open when it's not advantageous. Today it seems like the mods have to be idiot proof because today's operators are all idiots.

I'll spell it out again: Remove TR24. Set the mic gain control to center slot (midrange) and adjust as needed based on what you hear on your monitor receiver (you have a monitor receiver don't you?!) or what info you can glean from radio checks given by people you can trust. ALWAYS set the mic gain at least 25% lower when talking on SSB. That little rule is important and probably why the bullshit R131 mod became popular recently. Operators today don't understand that on SSB distortion is amplified. You HAVE to decrease the mic gain by at least a quarter if not a third when you're on SSB compared to when you're on AM. If today's operators understood mic gain there would be no controversy over removing Q24 in Grants and 148 and Q32 in 2950s and high-end Galaxys.

I disagree.

> The hams you've had "face to face contact with" must be
> KD6TAS and KD6VXI....

I've had contact with many "fine business" hams that
have their stories to tell (with pictures to prove it)
about their "wild times" when you can gain their
confidence. MUCH MUCH more than legal power levels
on HF bands like 40 meters are the most common. BIG
power on 10, 15, and 20 when contesting is also very
common. How many hams that have earned DXCC and higher
honors have done it legally in the last 10 years? If
you say anything more than 30% you're a fool. 10% is
more like it, and we haven't even touched the iceburg
of antenna violations.

You need to get with the program.

Yes, their are ways to open the chassis up...

Don't install the diode... Makes it sound like shit.

I have worked on a couple of those chassis for people on the newsgroup, and
they can be made to operate nicely (deadkey 1.5 watts and swing 20+), but
the mods are not for the faint of heart.

And now multiply that answer by 1.4 to get the efficiency ratings in their, too.

If your lucky... 60 percent on a transistorized amplifier is good.

The tube is rated (close) to 500 watts on the anode.

The Golden Eagles used approximately 1100 volts.

> mathematically prove your statements, their is something wrong..."

And your point is?

I suggest you get a TDR and find out the correct correlations between coax length, SWR, reflections and other variables that affect the operation of a station.

You like to spout off numbers, but so far have prattled only BS.

If you really want to see the losses and reflected losses in a piece of Coax, purchase a TDR.

I have used one in the past, and they prove you wrong.

Have a good one.

> 1) SWR meter is not calibrated for 50 ohms
> 2) Coax is not rated characteristic impedance

Gee, let's look at more reasons that are real world, come to life more often than not, and would REALLY have an affect on operations...

1. You are using "ends" or terminations (PL-259) on your coax that do not keep a continous impedance path on the circuit....

2. The transformer in the SWR meter is not completely accurate... This is a big problem with people. You can have an SWR meter that reads 50 ohms, but the transformer is not wound correctly, uses the wrong material in the core, or other problems.

3. The diodes in the bridge have not been matched. Seldomely done in MOST commercial designs.

I can go on and on, but I do believe that this proves a point.

>
> Regardless of which case it is, there is no good reason to modify the

> it does nothing. Under other (less than ideal) conditions, the results
> are unpredictable.

Wait... Just a couple posts ago, you stated that they where totally predictable and that you could figure out any length of a specific piece of coax and use it for a transformer.

Which is it.... The rest of us would like to know when you make up your mind.

The mag mount is the antenna that is used it is called this because it has a big magnet at the bottom to hold it to the top of the cab.There are other types e.g. mirror mount, connects to your wing mirror and gutter mount these connect to thr guttering on to of the cab there are also a few others but these are all ihave seen on lorrys

The unit is just the cb that you want

Im not sure about the voltage dropper but I think it is used to drop the voltage of the battery (I heard they are 21v or 24v or something like that) to the 12v that the radio uses to run.

hope this helps

John,

I liked what you had to say, but I want to add some of my thoughts.

>Maybe that way CB will once again be the quiet and peaceful
> >way for nearby neighbors to communicate. If you want to talk all over

Lets face it, the FCC made a fatal mistake of putting
CB in the HF band. To make matters worse, they put it
where the MUF rarely gets below - right on the edge,
perfect for world-wide DX! I am too young to know
why they put it there - but it doesn't take a expert
to know its the worst place it could be.

To the orginal author - do you think taking away amps
will make your radio any quieter? At a sunspot maximum
its possible to inadvertantly talk around the world

with a walkie-talkie putting out a milliwatt!!!!!!

Even if everyone completely obeyed the rules - its still going to be unbearably noisy when everyone is crammed into 40 channels and has 4 (!) watts to work with.

> >you too stupid??
>
> Well, I've run a fully LEGAL operation on CB for 24 years (since 1975), so the question is irrelevant, but just the same, the answer is NO, since just last month I obtained my Technician class amateur radio license. My callsign is KC2FNG. And, I agree with you in that the CB band, on which I am still active BTW, could use some serious cleaning up. However, I'd like for someone to post this FCC announcement or at least a URL or something where one can go and read the text of this FCC announcement, because I seriously question the FCC's ability (and in one instance, its legal authority) to do what your post indicates the commission has announced it intends to do.
>
> 73 de John, KNY2VS, KC2FNG
> http://www.buffnet.net/~kny2vs/welcome.html

I understand most Cbers don't really care too much about the technical side of radio, but I do. And what's more -

11 meter freeband is more "Amateur" radio than Amateur radio itself!! Freebanders have developed their own worldwide callsign scheme - that mostly everyone follows (it was developed by a group called "ALFA TANGO"). Callsigns are like this

2 RP 789

Where 2 is the country code,
RP is my radio group (or club)
and 789 is my unit number.

Find this in a handbook!! And thousands and thousands of people follow this! Also, 27.555 USB is known as the "call frequency" - you call CQ there, and QSY when you make a contact. You can always find out if 10 meters is open and being wasted - check 27.555 USB - it always has action. You would not believe the number of Austrailian stations on there (43 division, by the way). The whole division (country) list is available at http://www.alfatango.org/

Next, practically every radio that transmits above 27.405 had to be hand modified to do so - you don't just call up radio shack for this! You either have know-how, or know someone. Even most antennas have to be modified to transmit out of CB.

I myself, love 11 meters. After listening to 80 meters at night, say HAM radio is no better or worse.

I used to DX on 11 meters, I do not anymore, I strictly Short Wave Listen. Someday, I will get my HAM ticket - when the out-dated CW requirement comes down! To me, talking on the freeband wasn't immoral! Even If I had a HAM ticket, I could still cause my neighbor to hate me - ohhh, at least it would be legal! Anyway, I knew that my Kenwood TS-430S running well below the ALC was cleaner than some crappy Radio Shack model (harmonically).

That's all, to the original author - trying walking over to your neighbors house, I got DXing to do. :)

73s

Scott

Let's analyze your statement. You tried it with RG-213U so my
numbers for RG-58 and RG-8 are bullshit.

Hmmm. Let's go back to one of your earlier statements: "If you can't
mathematically prove your statements, their is something wrong..."

> Have a nice day.

Will do.

I never said it was a lot. You just can't admit that I'm right.

> Variations of a SWR reading skew much more than this with different
> coax lengths on a typical mobile antenna installation. Those "skews"
> are not attributable to coax losses.

That may be true. I can't speak for your case but I can think of think of two possibilities that would exhibit such behavior:
1) SWR meter is not calibrated for 50 ohms
2) Coax is not rated characteristic impedance

Regardless of which case it is, there is no good reason to modify the coax length in an attempt to improve the SWR. Under ideal conditions, it does nothing. Under other (less than ideal) conditions, the results are unpredictable.

Hi Vathsan,
Below are the rules of the CB radio service. It's a bit long, but at least you'll know the cold, hard facts as provided by the government.

73, Jeff KH6O

Title 47 - Telecommunication
Chapter I - Federal Communications Commission
Part 95 - Personal Radio Services
Subpart D - Rules for CB Service
Revised as of October 1, 1996

Citizens Band (CB) Radio Service

<RULE 1> Description
<RULE 2> Usage of Rules
<RULE 3> Who is Eligible
<RULE 4> Licenses
<RULE 5>Areas Of Legal Operation
<RULE 6>Special Restrictions
<RULE 7>Operating Channels/Frequencies
<RULE 8>Antenna Height
<RULE 9>Equipment
<RULE 10> Power Output
<RULE 11> Linear Amplifiers
<RULE 12> Permitted Communication
<RULE 13> Illegal Communication
<RULE 14> Paying for Actual Use
<RULE 15> Who Is Held Accountable
<RULE 16> Time Limit of Transmissions
<RULE 17> Identification Methods
<RULE 18> Emergency Usage and Assisting Travelers
<RULE 19> Remote Control Operations
<RULE 20> Telephone Patches and Telephony with CB
<RULE 21> Penalties
<RULE 22> Correspondence from FCC
<RULE 23> Notice of Interference
<RULE 24> Service to Transmitters and Antennas
<RULE 25> Modifications to Transmitters
<RULE 26> FCC Inspections
<RULE 27> Keeping Station Records
<RULE 28> Contacting the FCC

Rule 1 - Description

Citizen's Band Radio Service (CB) is a private, two-way, short-distance voice communications service for personal or business activities. The CB Radio Service may also be used for voicepaging.

Rule 2 - Usage of Rules

You must comply with these rules when you operate a station in the CB Service from:
{1} Within or over the territorial limits of places where radio services are regulated by the FCC.
{2} Aboard any vessel or aircraft registered in the United States or
{3} Aboard any unregistered vessel or aircraft owned or operated by a United States citizen or company.

Your CB must comply with Part 95/Subpart E [Technical Rules].

Where the rules use the word "you", "you" means a person operating a CB station. Where the rules use the word "person" the rules are concerned with an individual, a corporation, a partnership, an association, a joint stock company, a trust, a state, territorial or local government unit, or other legal entity. Where the rules use the term "CB station", that means a radio station transmitting in the CB Radio Service.

Rule 3 - Eligibility To Use CB

You are authorized to operate a CB station unless:
{A} You are a foreign government, a representative of a foreign government, or a federal government agency. or
{B} The FCC has issued a cease and desist order to you, and the order is still in effect.

Rule 4 - Licenses

You do not need an individual license to operate a CB station. You are authorized by this rule to operate your CB station in accordance with the rules stated in this Subpart. <*also read Rule 17>

Rule 5 - Areas of Legal Operation

You are authorized to operate your CB station from:
{A} Within or over any area of the world where radio services are regulated by the FCC.
Those areas are:
[1] The 50 United States
[2] The District Of Columbia
[3] Commonwealth of Puerto Rico
[4] Navassa Island
[5] United States Virgin Islands, it's 50 islets and cays
[6] American Samoa
[7] Baker Island
[8] Commonwealth of Northern Mariana Islands
[9] Guam Island

[10] Howland Island
[11] Jarvis Islad
[12] Johnston Island
[13] Kingman Reef
[14] Midway Islad
[15] Palmyra Island, and it's 50+ islets
[16] Wake Island

{B} Any area of the world, except, within the territorial limits of areas where radio services are regulated by -
[1] An agency of the United States other than the FCC, you are subject to it's rules.
[2] Any foreign government, you are subject to it's rules.

{C} An aircraft or ship, with the permission of the captain, within or over any area of the world where radio services are regulated by the FCC or upon or over international waters. You must operate your CB station according to any applicable treaty to which the United States is a party.

Rule 6 - Special Restrictions

{A} If your CB station is located on premises controlled by the Department of Defense you may be required to comply with additional regulations imposed by the commanding officer of the installation.
{B} If your CB station will be constructed on land of environmental or historical importance (such as a location significant in American history, architecture or culture), you may be required to provide information to comply with Part 1.1305 through 1.1319 of the FCC Rules.

Rule 7 - Operating Channels/Frequencies

Your CB station may transmit only on the following channels/frequencies:

channel	frequency(Mhz)	channel	frequency(Mhz)
1	26.965	21	27.215
2	26.975	22	27.225
3	26.985	23	27.255
4	27.005	24	27.235
5	27.015	25	27.245
6	27.025	26	27.265
7	27.035	27	27.275
8	27.055		

28		27.285
9*	27.065	
29		27.295
10	27.075	
30		27.305
11	27.085	
31		27.315
12	27.105	
32		27.325
13	27.115	
33		27.335
14	27.125	
34		27.345
15	27.135	
35		27.355
16	27.155	
36		27.365
17	27.165	
37		27.375
18	27.175	
38		27.385
19	27.185	
39		27.395
20	27.205	
40		27.405

{B} * Channel 9 may be used ONLY for emergency communications OR for traveler assistance.
{C} You must, at all times and on ALL channels, give priority to emergency communication messages concerning the immediate safety of life or the immediate protection of property.
{D} You may use ANY channel for emergency communications or for traveler assistance.
{E} You must share each channel with other users.
{F} The FCC will not assign any channel for the private or exclusive use of any particular CB station or group of stations.
{G} The FCC will not assign any channel for the private or exclusive use of CB stations transmitting single sideband or AM.

Rule 8 - Antenna Height

{A} "Antenna" means the radiating system (for transmitting, receiving or both) and the structure holding it up (tower, pole or mast). It also means everything else attached to the radiating system and the structure.
{B} If your antenna is mounted on a hand-held portable unit, none of the following limitations apply;
{C} If your antenna is installed at a fixed location (whether receiving, transmitting or both) it must comply with EITHER one of the following:
     [1] The highest point must not be more than 20 feet (6.10 meters) higher than the highest point of the building or tree on

which it is mounted; or

[2] The highest point must not be more than 60 feet (18.3 meters) above the ground.

{D} If your CB station is located near an airport, and if your antenna structure is more than 20 feet (6.10 meters) high, you may have to obey additional restrictions. The highest point of your antenna must not exceed 39.37 inches (1 meter) above the airport elevation for every 109.36 yards (100 meters, 1 hectometer) of distance from the nearest point of the nearest airport runway. Differences in ground elevation between your antenna and the airport runway may complicate this formula. If your CB station is near an airport, you may contact the nearest FCC field office for a worksheet to help you figure the maximum allowable height for your antenna. WARNING: Installation and removal of CB station antennas near powerlines is dangerous. For your safety follow the installation directions included with your antenna.

Rule 9 - Equipment

{A} You must use an FCC type accepted CB transmitter at your CB station. You can identify an FCC type accepted transmitter by the 'type acceptance' label placed on it by the manufacturer. You may examine a list of type-accepted equipment at any FCC Field Office or at FCC Headquarters. Use of a transmitter which is not FCC type-accepted voids your authority to operate the station.

{B} You must not make, or have made, any internal modifications to a type-accepted CB transmitter. <*read Rule 25> Any internal modification to a type-accepted CB transmitter cancels the type-acceptance, and use of such a transmitter voids your authority to operate the station.

Rule 10 - Power Output

{A} Your CB station transmitter power output must not exceed the following values under any conditions: AM [Amplitude Modulation] - 4 watts carrier power [CP] SSB [Single Side-Band] - 12 watts peak envelope power [PEP]

{B} If you need more information about the power rule, see Part 95/Subpart E.

{C} Use of a transmitter which has carrier [CP] or peak envelope power [PEP] in excess of that authorized voids your authority to operate the station.

Rule 11 - Linear Amplifiers

{A} You may not attach the following items (power amplifiers) to your type-accepted CB transmitter in any way:

[1] External radio frequency [RF] power amplifiers, also called linear amplifiers, or linears; or

[2] Any other devices which, when used with a radio transmitter as a signal source, are capable of amplifying the signal.

{B} There are no exceptions to this rule and use of a power amplifier voids your authority to operate the station.

{C} The FCC will presume you have used a linear or other external [RF] power amplifier if-

[1] It is in your possession or on your premises; and

[2] There is OTHER EVIDENCE that you have operated your CB station with more power than allowed by CB Rule 10.

{D} Paragraph C above in this section does not apply if you hold a license in another radio service (HAM, etc.) which allows you to operate an external RF power amplifier.

Rule 12 - Permitted Communications

{A} You may use your CB station to transmit two-way plain language communications. Two-way plain language communications are communications without codes or coded messages. Operating signals such as "ten codes" (10-4, etc.) are not considered codes or coded messages. You may transmit two-way plain language communications only to other CB stations, to units of your own CB station, or to authorized government stations on CB frequencies about-

[1] Your personal or business activities, or those of members of your immediate family living in your household;

[2] Emergencies;

[3] Traveler assistance;

[4] Civil Defense activities in connection with official tests or drills conducted by, or actual emergencies announced by, the Civil Defense Agency with authority over the area in which your station is located.

{B} You may use your CB station to transmit a TONE SIGNAL only when the signal is used to make contact, or to continue communications (Examples: tone operated squelch, selective calling circuits). If the signal is an audible tone, it must last no longer than 15 seconds at one time. If the signal is a subaudible tone, it may be transmitted continuously only as long as you are talking.

{C} You may use your CB station to transmit one-way communications (messages not intended for two or more CB stations) only for emergency communications, traveler assistance, brief tests (radio checks) or voice paging.

Rule 13 - Illegal Communications

{A} You must NOT use a CB station-

[1] in connection with activity which is against federal, state or local law;

[2] to transmit obscene, indecent or profane words, language or meaning;

[3] to interfere intentionally with the communications of another CB station;

[4] to transmit one-way communications, EXCEPT for emergency communications, traveler assistance, brief tests (radio checks) or voice paging;

[5] to advertise or solicit the sale of any goods or services;

[6] to transmit music, whistling, sound effects or any material to amuse or entertain;

[7] to transmit any sound effect solely to attract attention;

[8] to transmit the word "MAYDAY" or use any other international distress signal, EXCEPT when your station is located in a ship, aircraft or other vehicle which is threatened with GRAVE AND IMMINENT danger and you are requesting IMMEDIATE assistance.

[9] to communicate with, or ATTEMPT to communicate with, any CB station more than 155.3 miles (250 kilometers) away

[10] to advertise a political candidate or political campaign (You may use your CB radio for the business or organizational aspects of a campaign, if you follow all other applicable rules);

[11] to communicate with stations in other countries, except stations in Canada (on General Radio Service).

[12] to transmit a false or deceptive communication.

{B} You must not use a CB station to transmit communications intended for live or delayed rebroadcast on radio or television.
You may use your CB station to gather news items or to prepare programs.

Rule 14 - Paying for Actual Use

{A} You may not accept direct or indirect payment for transmitting with a CB station.

{B} You may use a CB station to help you provide a service, and be paid for that service, as long as you are paid only for the service and not for the actual use of the CB station.

Rule 15 - Who Is Held Accountable

You are responsible for all communications which are made BY YOU from a CB station.

Rule 16 - Time Limit of Transmissions

{A} You must limit your CB communications to the minimum practical time.

{B} If you are communicating with another CB station or stations, you, and the stations communicating with you, must limit each of your conversations to no more than five (5) continuous minutes.

{C} At the end of your conversation, you, and the stations communicating with you, must not transmit again for at least one minute.

Rule 17 - Identification Methods

{A} You need NOT identify your CB communications...

{B} You are ENCOURAGED to identify your CB communications by any of the following means:

[1] Previously assigned FCC CB call sign

[2] K prefix followed by operators initials and residence zip code

[3] Your name; or

[4] Description of your organization including name and any applicable

operator unit number

{C} You are encouraged to use a "handle" (nickname) ONLY IN CONJUNCTION WITH the methods of identification listed above in paragraph B of this section.

Rule 18 - Emergency Usage and Assisting Travelers

{A} You must at all times and on all channels, give priority to emergency communications.

{B} When you are directly participating in emergency communications, you do not have to comply with Rule 16 about length of transmissions. You must obey all other rules.

{C} You may use your CB station for communications necessary to assist a traveler to REACH A DESTINATION or to RECEIVE NECESSARY SERVICES. When you are using your CB station to assist a traveler, you do not have to obey Rule 16 about the length of transmissions. You must obey all other rules.

Rule 19 - Remote Control Operations

{A} You MAY NOT operate a CB station transmitter by RADIO remote control.

{B} You MAY operate a CB transmitter by WIRELINE remote control IF you obtain specific approval in writing from the FCC. To obtain FCC approval you must show why you need to operate your station by wireline remote control. Send your request and justification to: FCC, Gettysburg, PA 17325. If you receive FCC approval, you must keep the approval as part of your station records (read Rule 27 on station records).

Rule 20 - Telephone Patches and Telephony with CB

{A} You MAY connect your CB station transmitter to a telephone if you comply with ALL of the following:

[1] You or someone else must be present at your CB station and MUST-

(i) manually make the connection (the connection cannot be made by remote control);

(ii) supervise the operation of the transmitter during the connection;

(iii) listen to each communication during the connection; and

(iv) stop all communications if there are operations in violation of these rules.

[2] Each communication during the telephone connection must comply with all of these rules.

[3] You must obey any restriction that the telephone company places on the connection of a CB transmitter to a telephone.

{B} The CB transmitter you connect to a telephone must not be shared with any other CB station.

{C} If you connect your CB transmitter to a telephone, you must use a phone patch device which has been registered with the FCC.

Rule 21 - Penalties ++may not be current penalty information.

{A} If the FCC finds that you have WILLFULLY or REPEATEDLY violated the Communications Act or FCC Rules, you may have to pay as much as $2,000++ for each violation, up to a total of $5,000++.

{B} If the FCC finds that you have violated any section of the Communications Act or FCC Rules, you may be ordered to stop whatever action caused the violation.

{C} If a federal court finds that you have WILLFULLY and KNOWINGLY violated any FCC Rule, you may be fined up to $500++ for each day you committed the violation.

{D} If a federal court finds that you have WILLFULLY and KNOWINGLY violated any provision of the Communications Act, you may be fined up to $10,000++ or may be imprisoned for one year++, or both++.

Rule 22 - Correspondence from FCC

{A} If it appears to the FCC that you have violated the Communications Act or these rules, the FCC may send you a discrepancy notice.

{B} Within the time period stated in the notice, you must answer with:

[1] A complete written statement about the apparent discrepancy;

[2] A complete written statement about any action you have taken to correct the apparent violation and to prevent it from happening again; and

[3] The name of the person operating at the time of the apparent violation.

{C} If the FCC sends you a letter asking you questions about your CB radio station or its operation, you must answer each of the questions with a complete written statement within the time period stated in the letter.

{D} You must not shorten your answer by references to other communications or notices.

{E} You must send your answer to the FCC office which sent you the notice.

{F} You must keep a copy of your answer in your station records.

Rule 23 - Notice of Interference

{A} If the FCC tells you that your CB station is causing interference due to technical reasons, you must follow all instructions in the official FCC notice (This notice may require you to have technical adjustments made to your equipment).

{B} You must comply with any restricted hours of CB station operation which may be included in the official notice.

Rule 24 - Service to Transmitters and Antennas

{A} You may adjust an antenna to your CB transmitter and you may make radio checks (One-way transmissions for a short time in order to test the transmitter).

{B} Each internal repair and each internal adjustment to your FCC type-accepted CB transmitter must be made BY or under the DIRECT SUPERVISION of a person licensed by the FCC as a GENERAL

RADIOTELEPHONE OPERATOR.
{C} Except as provided in paragraph D below in this section, each internal repair and each internal adjustment of a CB transmitter in which signals are transmitted must be made using a NONRADIATING antenna (Dummy Load).
{D} Brief test signals (signals not longer than one minute during any five minute period) using a radiating antenna may be transmitted in order to:
     [1] adjust an antenna to a transmitter;
     [2] detect or measure radiation of energy other than the intended signal; or
     [3] tune a receiver to your CB transmitter.

Rule 25 - Modifications to Transmitters

{A} You must not make or have any one else make any internal modification to your CB transmitter.
{B} Internal modification does NOT include:
     [1] Repair, or servicing of a CB station transmitter; or
     [2] Changing plug-in modules which were type-accepted as part of your CB transmitter
{C} You must not operate a CB transmitter which has been modified by anyone in any way, including modification to operate on unauthorized frequencies or with illegal power.

Rule 26 - FCC Inspections

{A} If an authorized FCC representative requests to inspect your CB station, you must make your CB station and records available for inspection.
{B} A CB station includes all of the radio equipment you use.

Rule 27 - Keeping Station Records

Your station records include the following documents, as applicable:
     [1] A copy of each response to an FCC violation notice or an FCC letter.
     [2] Each written permission received from the FCC.

Rule 28 - Contacting the FCC

{A} Write to your nearest FCC Field Office to:
     [1] Report an interference complaint; or
     [2] want to know if the FCC has type-accepted a particular transmitter for CB service.
{B} Write to the FCC if you have questions about the CB Rules: FCC Private Radio Bureau Personal Radio Branch
Washington, DC 20554

While the Grant XL mods are fresh on everyone's mind, I notice that with TR24 gone, turning VR11 doesn't affect SSB power output. It seems it's always at a maximum of about 20 watts. Is this what is sposed to happen when TR24 is removed?

Thanks
-RC

The guy's just jealous that he will never have the money nor the knowledge to
put together a system that equals what is heard on The Bowl.

Illegal?  Of course.  But as a person who has always been fascinated with the
technical side of radio communications,  I cannot help but to be a little
impressed at someone who is able to generate 10,000 watts (or more) of RF power
from a moving vehicle.

Yes but just turn down the mic gain if you have any complaints.
If you don't like that, then you could try to replace tr-24 and then
remove r 131

For five years, I ran an Antron 99 with the optional ground-plane kit. It was good for approx. 10 miles on A.M. (stock radio) and 30 miles SSB. I have since "up graded" to the IMAX-2000 which has given me approx. 17 miles on A.M., and 60 miles on SSB. I have talked to Kingston Ontario Canada, from Watertown, New York on MANY occaisions. Get out your map. Oh... and incidently, my IMAX is EXACTLY 26 feet LOWER than my Antron 99 was. My IMAX is on a 10 foot mast on the roof. My Antron was on a 36 ft. mast on the roof.

You're confusing some items here. The mismatch does create standing
waves. What I am saying is that losses along the cable reduce the
magnitude of the standing waves. The SWR actually decreases as the
reflected power becomes attenuated.

> > The only reason you get different readings is due to coaxial losses.

OK. Despite the fact that you haven't really given me anything to
support your side, I'll give you something to support mine.
Look in your ARRL Handbook at the end of the chapter (probably 16) on
transmission lines. There is a plot of "SWR at transmitter" versus
"SWR at antenna". Read this and tell me again how line losses do
not affect SWR.

> > The Standing Wave Ratio is, in essense, a measure of the ratio of

Who said it was a "ratio of the forward power to the losses"? Not me!

Sorry, you've got it wrong. The readings will not be identical
(however, they may be close). You are calling the ARRL Handbook
a liar. You better contact them and let them know their erroneous ways.

>   The only way these power

> low.... When in fact it is not.

Absolutely false. If the power level changes, where does the power go
(or come from)? You are forgetting about conservation of energy.
Forward power and reflected power are constant along a coax. The
voltage maxima and minima are created by the sum of these two waves;
they have no effect upon it. Furthermore, voltage maxima and minima
have no effect on the SWR reading.

> Try using an RF Ammeter to measure these things.... Or add a 4 foot section

>
> Welcome to reality. You can check yourself in at the door.

Hee hee! Look at what you are saying: "a lossy cable will not affect
my 1:1 SWR reading." No shit! But that proves nothing.

> > You originally said "reactive". How is a a reactive antenna impedance
> > any worse than a non-50 ohm resistive antenna impedance? The answer is
> > that it isn't.
>
> Bullshit. If you have reactance on your feedline (40 ohm Z with +10j), you
> will see an impedance of 50 ohms.

What are you talking about? 40 + j10 ohms does not equal 50 +j0 ohms.

Answer this:
Which antenna radiates more power?
Antenna 1 with an impedance of 49 + j11 ohms, or
Antenna 2 with an impedance of 40 + j0 ohms

What is the SWR for each?

I won't keep you in suspense. They both have an SWR of 1.25:1 and
the both radiate the same amount of power. My point is that antenna 1
with the reactive impedance is no better than the resonant antenna 2.

> Their is a mismatch, though. However,
> the antenna will radiate its best because it is "resonant".
>
> This is where (at the least), a noise bridge comes in handy!

I thought there was some correlation with you and noise.

On the contrary, your statements contradict reality and the ARRL Handbook.

All you can give me is a bogus "look at the book." I've told you exactly
where to look in the book.

> > > > A mismatch is a mismatch regardless of whether it is reactive,

> watts.

It's not a question of what resonance is. It is a question of how, as
you claim, it is inherently better. I've given an example above of how
it is no better than a reactive antenna. Your impossible mission, should
you choose to accept it, is to show how my example is wrong.

There is no single correct way; there are multiple ways. A coaxial
matching transformer can be used to match any impedance -- even a
complex impedance. I can match that impedance with one component; you
require two with your "L" network. Who is the simpleton?
Try me. Give me an impedance to match.

> > I can match a 40 ohm impedance with a quarter wavelength of 44.76 ohm
> coax.
>
> And that is a handy number, isn't it?

My point is that it can be done. And I told you how to do it.

> > But that is not what we were discussing.

> > there are no currents on the outside of the coax.
>
> So you are saying that a Balun is unneccesary?

Unnecessary for what? Tell me how a 40 ohm terminating resistor makes
current flow on the outside of the coax. That is what you said.

> Or are you saying that if you have an antenna that is 10 ohms, you don't
> need a matching network?

I never said you don't need a matching network. I said current will not flow on the outside of the coax by virtue of the antenna impedance. Understand the difference?

> Or are you saying that an antenna that is RESISTIVE 50 ohms, and not
> reactive in the least will not have outside currents...

No, that is what you are saying. I say the antenna impedance does not determine whether or not currents flow on the outside of the coax; other factors do. If I feed a horizontal resistive 50 ohm antenna with an unbalanced transmission line, it will experience currents on the outside of the coax due to the current imbalance; it has nothing to do with the impedance.

> I agree with the last statement,

Yes and you are wrong.

> but that is rarely the case because FEW

> (notice the different words there....)

No. Mismatches include reactive loads (or did you think a reactive load was a good match?).

>   Current on the
> > outside of the coax is caused by other factors like a poor counterpoise
> > or imbalanced antenna currents.
>
> Which a reactive load can present.

No.

So you think a coaxial matching transformer *does* radiate power?

> Try to run a piece of coax that you are using for a G5RV down the side of a
> grounded tower.
>
> You have a tower, right? If so, give that a simple try... It would even
> work with a dipole, as a center fed, horizontal dipole doesn't terminate in
> 50 ohms... You use a quarter wave transformer to get the feedpoint their.

Ahh, but you are talking about something different now -- exactly what
I have been saying. You are feeding a balanced antenna with an unbalanced
feedline -- this causes a current imbalance and creates currents on the
outside of the coax. These currents are not caused in any way by the
antenna impedance; they are caused by the current imbalance (the "other
factors").

> > Better watch what you say, the CLP will arrest you!
>
> I care?

You obviously don't care what you say.

You're talking about two different items here:
1) the desired length of a 50 ohm coax in a mobile installation,
   (short is best, no specific length is required)
2) creating a coaxial matching transformer
   (a specific length and non-50 ohm impedance required)

You know the difference but your refusal to acknowledge some realities
has degenerated your dialog into a search for discrepancies in an
"apples and oranges" comparison.

```

There was a discussion recently about the Midland 79-290 CB. I've currently got a Uniden 76XLW and have been wanting to get a radio with SSB *and* Weather reception. The Midland one caught my eye. Its a nice looking radio.

Now, the chatter here says this radio is extremely sensitive to engine noise. How bad is bad? Comparable to the Uniden radio? Is there something I can do to reduce this excessive engine noise reception (besides solving the source of the engine noise, I've been all through that already and the fixes would be exorbitantly expensive)

There was also some sort of modification available that narrows the splatter? Is splatter a problem with the Midland?

Otherwise, I'm in the market for a SSB CB that also receives NOAA weather broadcasts. The Midland's size is attractive too, since I could easily mount it in the dashboard of my small car, instead of hanging like a bomb in the passenger footwell like my Uniden rig.

I see Texas Ranger makes a SSB/NOAA CB. Are those decent radios?

Thanks for any input!

-Skorzy

Do you need the 6 meter version with the 6CA7 driver tube or the version
without the driver tube?

Mike

hi i have 148 with a didgi scan 400 on it there good but it wont work right
until you have the radio wide banded whe i got the digascan put on it you
will have to take out the pll chip and if ya dont widband it you will only
recive from about 26.505-28.000   and the 400 gos from 25.995-28.000 i dont
have a book for them but if ya find one let me know i also have a extra
didascan 400 im thinking about puting on a sbe consel 2 you can email me at
smallengine@hotmail.com in the next week or 2 ill be taking my 148 out of my
truck for some genral work ill see about finding out what has to be done to
hook it up i hope you have a freq counter it will take some ajustments and
modification to

Hi , anybody have a book on the digascan hookup to a cobra 148 GTL ? Just
has
the power cord and two other 2 strand cords so it shouldn't be too hard
.Just
email me @ clfastback@aol.com . Thanks in advance , Chris

Hi,
I would like to know the uses of a 40 channel CB Transceiver. And also what exactly this device is. I believe it is a 2-way communication system. Does this also behave as a radio? Just curious to know if it can be used in emergency (say..if you are trapped in a car in snow...).

I understand that one can't dump 10 pages of text in here...so, if I can get a web site which answers my questions...it would be helpful.

Thanks,
Vathsan.

well i noticed even on ebay , these amps are going for top dollar, i guess
someone might as well buy a new one as a used one, however if you are a
dealer then so be it, you are as good a source as anyone else.

Hey Toll,

Did I miss a photo?

I went to that site, thanks, but no mention of Mitsubishi.

What connection is there between the two companies.

I've e-mailed them requesting a tech data sheet.

On the site they mention an even meatier unit, 500A @ 28V.

Surely there can be no stopping P. Dahl re-winding the primary of his
mobile CH6 transformers to cater for this beast - it'll win the single
alternator hands down.

What do you think?

 I purchased a Midland 77-285A for $20 bucks on clearance @ a store
called AutoFun, but don't know anything about it.  Does anyone have
info on it, or mods.  I'd like to extend it's range if its at all
possible.  Any help is appreciated!
TIA     -Chris

ALC is automatic level control for SSB and AMC is automatic modulation
control for AM, dorking with these will probably cause splatter.

at the age of these trucks, especally if you live in the salty winter north,
you may have corroded grounding straps between the body and frame.
they mount the bodys on rubber shock mounts to reduce road noise and install
ground straps usually between the engine block and firewall. your negative
battery ground runs right to the engine which is also mounted on rubber mounts.
if you loose the ground straps, everything in the cab / body of the truck tries
to ground through the rear axle, drive shaft and transmission to the engine
block which is spotty at best due to the oil coating on the rear end gears and
trans. gears. if you replace / clean the ground straps, you'll find that your
lights are brighter, your swr should come down and your dash board radio may
sound better with less static on fringe am stations.
good luck
jeff

> plus s/h from 48089 MI Thanks.

There are a lot of hams who make it their business to
market amps to CBers on a regular basis for profit.

But I think a majority of hams do not think twice about
CBers -- figuring that what happens on 11 meters is none
of their business. When these folks sell their old equipment
they take a "what I don't see - I can't disapprove of" stance.

There's been a lot of discussion whether this is responsible

behavior or not. On the one hand, it's up to the individual
buyer to stay within FCC rules. On the other hand, hams
may be (unknowingly) contributing to the trash on 11 meters
by putting amps into circulation among CBers.

It would be interesting to hear some honest, non-biased
and non-flaming opinions on this issue.

no, i'm not bored. quite the contrary i live for this news group. the only boreing thing about this whole thing is having to ask the same question over and over again to block heads like you but for you benifit i will ask it one more time:
WHO IN HELL DO YOU THINK YOU ARE TO TELL ME / US WHAT TO DO / NOT DO ON A BAND OF FREQUENCYS THAT DON'T EVEN CONCERN YOU AS A HAM OR CB OPERATOR. YOU HAVE ZERO AUTHORITY TO TELL ANYONE ANYTHING ABOUT LEGALITIES UNLESS YOU WORK FOR THE FCC, PAY OUR FORFITURES OR ARE SOMEONES MOTHER!!! UNLESS YOU'RE HOLDING BACK INFORMATION ON ONE OF THESE THREE SUBJECTS, SHUT UP!!!
if you read ALL of those 33 posts, you'll find that MOST of them were in response to other things that i've written.
are you going to be a hypocrite now and tell me that i shouldn't be here after we all hashed the "who has the right to be here" subject 2 months ago?
if the high and mighty hams have the right to come here and post spam, off the subject, responses to others questions and have their noses up our asses, then i have the right to be a barbed thorn in your / their ass also.

meanwhile, i still haven't heard an answer to the above question.
jeff

Hi,

I would like to know the uses of a 40 channel CB Transceiver. And also what exactly this device is. I believe it is a 2-way communication system. Does this also behave as a radio? Just curious to know if it can be used in emergency (say..if you are trapped in a car in snow...).

I understand that one can't dump 10 pages of text in here...so, if I can get a web site which answers my questions...it would be helpful. But, if you can answer to the point...cool.

Thanks,
Vathsan.

Grounding should not have any important effect on your SWR or range with
this antenna.

The TX 400 will do just about exactly double what the Palomar 225 did.

You can run that fine on a vehicle with a 30 amp alternator.

Yes, the Johnsons use plate modulation, and yes, you are right about high level modulation producing a better sounding transmitted signal.

Two tubes driving three or four (depends on the model) 6146Bs.

You can also replace the rectifiers in them with solid state ones and get better, cleaner, louder audio (as well as a couple more watts).

Total price of parts is on the order of 20 dollars. About 5 or so if you know how to wind the combiner and splitter.

Much less expensive than replacing a pair of 250s with a 500.

Toll Free

Why email you....

A splitter and combiner is no secret!

I explained how to do it a week ago and it was done.

I can also vouch for Phil's technical expertise... . He can do it himself.

Why?

It is a single stator alternator, so they cannot NOT allow it!

If they did, I would demand my dollars back and walk off the line, as would others.

Besides, this is a DC output alternator...

Run it in AC sky with a gang of batteries in the back!! ;-)

You can't mix 75 / 50 ohm components / equipment and get an accurate reading / measurement. For your test results / readings to be correct, you have to use 50 ohm components with 50 ohm equipment, etc. It's like taking pain pills to hide a syptom instead of correcting the problem. You have to correct the condition to avoid a serious problem down the road.

> I've never seen a "legal" galaxy radio with a roger beep in it.

Then you have never seen a 949 or 959. I was surprised as hell when a gentleman in California sent me one.... Out of the box... Labeled on the front panel (along with a variable output power knob... Both functional out of the box), and an FCC ID plate on the back of it.

They only do 40 channels, with the RCI MB8719 chip in them.

 Most
> Galaxies are exports. I'd like to see the FCC ID number on any radio
> proporting itself to be "legal" with a roger beep in it.

The 949 and 959.,..... For about the millionth time.

 I really think
> the FCC is slipping if they allow things like this

Why? They can be used in a useful manner.... Not that everyone uses them in that manner, but they can be.

. What's next, legal
> radios with built-in echo boards?

Doubtful.... Too many manufacturers of toys would be put out of business!
;-)

>
> The reason why you hear these roger beeps 10 channels away is because he

> same people that think roger beeps are so "cool", also tend to be the
> ones that clip limiters.

That comment, I will agree with. It is most unfortunate, too.

A roger beep will drive the modulation output
> to an almost perfect squarewave, which will splatter like hell, unless
> the limiters are intact.
>
> I'd venture to say that the MAJORITY of operators that use roger beeps
> in my area, do not do it to facilitate communications. They do it
> because THEY THINK it sounds cool. THAT, to me, falls under
> entertainment, or amusement.

Yes, but that is your opinion, and for that one opinion, I can counter that
properly used, a roger beep can be useful.

I have used them before, and they do help.... If they didn't, would NASA
use them?

> If the tone is uses as defined to signal endo of transmission, on SSB,
> where there is no carrier to signal a station has unkeyed, then yes, I'd
> believe that its use would be legal. Ironically, most SSBers dispise
> noise makers, so they tend to avoid roger beeps.

Don't work much international sub 1 s unit DX do you?

There is no need to use
> an end-of-transmission tone on AM where there is a steady carrier to
> signal when someone ends his transmission.

Don't work much weak signal DX on AM, do you

The use of a roger beep on AM
> is superflouous.

See my comment above. They can be useful their, also.

>
> And this applies to single tones only. The minute you go the "musical"
> note route, you have crossed the line from (Questionable) useful tool to
> entertainment device, and that is CLEARLY illegal.

Agreed.

>
>
> Since legalities have little meaning on CB radio, the fact remains that
> roger beeps are damned annoying to anyone that is not anamored with
> them.

That is your opinion only. Please keep to facts here. Opinions are like....

 Same with echo's. These "noise toys" are nothing more than radio
> billboards advertizing the operator "Look how cool I am, don't you wish
> you were me", and usually the total opposite is the case.

It has also been shown that under weak signal work, an echo, PROPERLY ADJUSTED can help to bring your signal out of the noise (really, it makes the other operator strain to hear you... And it isn't true ECHO, but you set it to be more of a Chorusing effect).

Actually, dumbfuck, I don't have a MARS / CAP mod to anything but my HF rig...

The rest of the bands (and I have capabilities from 6 meters on up) are strictly legal and legit, unless needed to open up the RX section.

Thankfully, Alinco usually has a seperate mod for opening up the RX section..

I run power. That is what excites me.

Not frequencies.

Get it right.

I made a dipole once for the heck of it. Hooked it up 4-5' above the ground
between 2 fence posts. Used it awhile and then tried putting a 6' X section
of chain link fence under it. It worked great. The signal went mostly
straight up, I was talking to Australia and Hawaii,etc during the day on ssb
12 watts.

Everyone knows amps on 11 meters are illegal. So what? So we have the holier-than-thou schmoes out there trying to convince us that we ought to change our ways. Look, I,ll make it real simple 4 u self appointed cops and monitors or whatever the hell u refer to yourselves as. We know the risks, if we take the chance, most of us are ready to deal with the consequences should the heat come down. I have respect for MOST hams, but I achieve the same results at a fraction of the cost. If I bleed a neighbor, all they have to do is knock on my door. We will work it out. I have been in the same area for quite some years and have no problems. If I am not hurting anyone, why the hell should you care WHAT I do? The bottom line is you shouldn't. Get a life. You guys that bitch about us freebanders and "peaked" radios have way too much time on your hands. I don't need to run anymore than 30 watts where I am located and I talk all over the world......yes.. on the freeband. Nothng pleases me more than one of you cb rambos to come in to my conversation and start preaching about rules. God, I love to squash you suckers.

Damn near the same as a Heathkit SB220.

The major difference is in the bandswitching area.

Dick basically copied the SB220 for his design.

> to sell them as such. It's not like you can make a 10 meter only amp...

That's a nice way of looking at it, but it's 180 degrees
from the truth. In truth, the amps were designed SPECIFICALLY
for CB with the LOOPHOLE that they'll also work as wideband
HF ham amps. That loophole was closed in the middle 70's.
Think about it. How many hams in the 70's needed 4 watts
in/100 watts out amplifiers? They were probably selling
at a 1000:1 CBer to ham ratio. It's MONEY that matters.
In the 70's there was money in CB. Companies sprung up
overnight hoping to cash in. CB amps are CB amps. Your
post represents a nice sentiment--but it's wrong.

That statement is not entirely true.

You feed a center fed dipole with a transformer made of 75 ohm coax. Take the SWR measurement at the feedpoint of the coax.

The Coax acts as a transformer in this case... As it does if you put any antenna that has a reactive component on the end of the wire....

Yes you will still get the correct voltage, but you run a grater chance of
inducing noise from some of the electronics in the car. I have a 79-290 and
love it by the way. You made a good choice.

Really....

You said...

"Of course they can't all be mighty Uniden radios, now can they? Hmm.. I wonderhow many other radios carry the insides of the mighty Uniden radios but have adifferent name on it... Hmm.. now that I think about it, I believe a few of the "Rat Shack" radios as you put it are the identical radio as some of the
Unidens.. gee, imagine that. I guess they must be pieces of crap too..."

To paraphrase that, you said

"Some radios where sold under the Radio Shack name that where also sold under the Uniden name".

Then, I said,

"The Washington was also sold under a "Rat Shack" name."

Seems like I agreed with you.....

Tell me where this is cryptic?

I boldfaced stated that the Washington chassis was sold under the "Radio Shack" name.....

I guess I miss your point? Either that, or you miss the English language!

like i just told rfenforcer, i'll have to see that one in the rule book. if
it's not there, it's still against the rules and my statement still stands
because every rf policeman in this news group is beating us over the head with
the technicalities so here's one for you. as far as your engineers statement, i
don't doubt what you say because it would be a matter of selective enforcement.
it would be too much for them to do their jobs.
if it were alright, why don't the people at these monitoring stations say
something to the offenders??? if they were to make their presence known, more
people would be wary of being there in the first place.

Run a ground strap from the trunk lid to the car body, do this with the
hinge bolts.
Also make sure the set screws under the lip mount are making good
connection. Keep in mind that if you add a ground strap it needs to be as
short as possible. try running it from the antenna mount to the vehicle body
(not the trunk lid) and see if this helps, just keep the strap as short as
possible.

It is amazing and equally exciting Im sure it is just a shame that it
requires you to break a law to do this type of hobby, I wish there was a
stipulation somewhere that allowed the guys that would like to experement
with this large amount of RF the right to do so.

Technically Jack you can just simply tie the inputs and outputs of these amps together and retune your input and output shunt, now I personally would not do this or suggest doing this but you would still get output from both amps assuming there is no canalization between the two, But with two ferrite beads, two 100 ohm resistors and a couple of feet of teflon wire and you would basically have a Texas star 400, now this would require some retuning to achieve a good match between the two sections, it is fairly simple just not suggested for the inexperienced, and I would be willing to bet you could learn a lot from Phil.

>
>
what are you talking about?
aside from the freq difference, the rf technology and propagation are almost
identical between 10 and 11 meters as evidenced by the interchangeablity of cb
and ham radios to both services

.>it creates a
>garbled communication of "doublespeak"
 it's too bad that cber's got there too late. hams have held the patent on this
one since the 1950's.

> I don't think I am superior to ANY one, yourself included.

boy, talk about double speak!!!!!!!!!!!!
all of the hams of the rf police persuation act as though God only speaks on
ham freqs so don't run that shit on me boy.

> But I also am
>not about to kowtow to someone who is either blatantly trying to hogwash
>otherwise unknowing persons about basic RF practices, or is himself unaware
>and
>is trying to bluff his way through it.
>
>73
>
>Steve

if you and the other rf police would only practice what you preach in this last
line, the war would be over and peace and prosperity would reign here for
10,000 years. i have to admit that you have said so eloquently in this last
line, what i've been trying to say here for 5 months to all of those
clay-footed Gods out there.
seriously, i like it so much that i will repeat it here and print it up to hang
on my desk:
> But I also am
>not about to kowtow to someone who is either blatantly trying to hogwash
>otherwise unknowing persons about basic RF practices, or is himself unaware
>and
>is trying to bluff his way through it.

this is the essance of what my point has been all along.
THANK YOU SO MUCH.

i could be wrong so pray tell, where is yahoo or the auctioner that you refered
to based? he may still be from another country where you may need a lic. to
purchace ham equipment.
i will not try to fool you about computers, my knowledge is some what limited
in this domaine but it seems that many posts that come out of yahoo as well as
other sites that i've seen in yahoo make referencs to the U.K.
more info on this would be an education.

Hmmmmmmm Yes...Puerto Rico, I'm sure you think it's halfway between
Madrid and Barcelona on the Iberian Penisula. You must either be "Brand
New" to the planet.....or don't get out of the trailer park much.....

when you're not dancing the side-step with Gary and JJ, you should make pretzels.
between that other "muhfuker" post that you smeared here and the way that you pull my words and sentences out of context and twist them, all that you need is an oven.
don't run your shit on me, BOY!!!
it took me long enough to stop rhooligan2 from lying like that and i had to do it to him and make him look bad in the process just to prove the point.
it's rough sometimes to have to use a water cannon to put out a candle like yours but if it's nessessary, the water bill would be worth it. if you're going to be a liar, at least be a man about it with your own words and not mine. now that you've shot yourself in both feet and blown your dick off, it looks as if you are taking aim at your mouth. if so, don't miss, it would be difficult to contain the vacuum from your head should it be realeased.

A number of things I can't figure out...
Why is it so hard for "Ms.Angle" to simply state whether she sent an e-mail or not? Why does it matter to her whether the mail could have been faked? She should be able to remember whether she had to deal with a "ScanShack" website and the use of the term 'shack', shouldn't she? Would SHE somehow be liable if she admitted writing it, or not writing it?
She could save herself and Tandy a lot of headaches if she would admit or deny it with a simple answer to a phone call... wouldn't take her more than three seconds and the "truth" would finally be out, rather than all the speculation and hard hits at Tandy's expense (not that they don't deserve some ridicule for MANY blunders!)...
Why didn't they send ScanShack a real, registered letter by real post if this was so important?
Of course, there's the obvious question of the absurdity of the claim, and the "rights" involved with the term 'shack'. OR 'radio'. Or any of a number of ridiculous and questionable statements put forth by "Ms. Angle" or whomever wrote this mailer to ScanShack.
If it IS from Tandy, screw them, keep the site up, they haven't a case.
If it ISN'T from Tandy, keep the site up anyway, as there is no real threat.
Please check with all your local/state licensing depts', and have an attorney friend call Tandy and Ms Angle... two minutes with any attorney worth his or her salt and Tandy will have to cower away with its tail between its legs... this is one of the most absurd claims I've ever seen! :-)
Mike

>intending
>to sell them as such. It's not like you can make a 10 meter only amp...

EXACTLY MY POINT!!! THANK YOU.
the rf police are always hawking the evils of the insidious CB AMP. even when i
try to defend their right to use them, i'm wrong.
when the big flap came up a few weeks ago about the fcc allowing local police
to enforce regs, i stated that it was stupid because a lic. ham could legally
use a modified cobra 148 and a texas star 350 on 10 meters and an un-trained
cop at a glance wouldn't know the difference and they still tried to find fault
with my logic.
go figure???

take a valium, relax and get your shit together before you try to tangle with
me, BOY.
>Keep your "personal definition" to yourself. The
>rest of us know what that word means,

by this quote of yours, it seems to me that you prefer the traditional,
biggoted definition.

 >Keep your "personal definition" to yourself.
what's the matter, don't you like my color / race neutral definition or did you
find something of yourself in it???

This is most interesting, but have you actally turned
on a cb lately and seen just how many people follow
these rules?  How bout 0?  That's the way it is
around here anyways.

ok asshole, where in the rules is it written that a LEAGALLY LICENCED HAM can't use a "homebrew" modified cobra 148 and a texas star 350 for example on 10 meters so long as it meets spectral pureity standards??? if that fcc / local police law were to pass and a cop were to see such a setup in your car and confiscated it, there would be a trail of shit and tears from your car to your lawyers office!!!

jeff

Actually, that's not entirely true. It's illegal for a RETAIL outlet to
sell AS NEW an older formally type accepted (But not by today's rules)
radio. But there is nothing illegal for private parties to sell old
radios.

Does the reflector help your skip shooting?

Is it connected to the ground, or just laid under there?

Thanks,
Scott

I got one for all you Guru's of CB land...
I have a Midland 77-838 and would like to know if and how I can mod it?

Extra channels, more output, anything to give it a little more kick and
maybe a little more...

Anyone out there that can assist?

Scott

you pompus, narrow minded, lie-to-yourself, self centered idiot!!!
you MUST be the only ham that you know to believe what you just said.
if i were you and said that, i, in all honesty, would have to have a BULLSHIT
disclaimer tatooed on my forehead and use it for my e-mail id'er.
there is absolutly no defense for your statement!!!.
in the famous words of steppenwolf in their song, tighten up your wig:
your mind is so narrow that it's no suprise
if you fell on a pin, you'd be blind in both eyes.
if you're going to "tighten up your wig", you should really use a torque
wrench. i don't think that it's up to specs right now.
i'll bet if you went to a ham fest that you are unknown at, (all of them, i'm
sure), and passed out an annonomous questionare to all hams in attendance and
slipped in a question about wether or not they had some form of illegal
equipment in their shack, you would be stunned at the answer. try it sometime
you and your opinion will be sorry you did.

maybe so but the fact remains that hams can and do legally use so-called "cb"

amps on 10 meters and ham freqs below.
if the fcc were to make a regulation with associated penalties that such amps
could not be sold to anyone without presentation of a valid ham lic or
exporters lic. it would, at least slow down distribution of these amps on the
market.

It depends on what you want to use it for,for 10M the RCI 2950 is a pretty good rig and I have never had one come back.The mirage 2950 has 12 M also but these seem very unreliable with a wide range of problems.Neither is legal as a CB but they work well.

I can't believe you are surprised by noise if you run the coax through the
firewall, where like 90% of the cars wires are located.  Plus I don't
think it would change much with a different manufacturer.

Don't ya love guys who throw out percentages and have no basis for it? Well, let me try. I think that 10% of women that are straight really wish they were lesbian, 79% of all factories knowingly polute the air, 55% of all police officers are "on the take", hmm.. any other percents I can make up?

About the only problem I've had with Radio Shack radios is the price. If you live in an area where Radio Shack is the only "CB" store around, you're pretty much stuck unless you use mail order, but if you have a CB store in your area, you're better off going there and buying the same radio with a different name, cheaper.

just for laughs, does the power knob allow stock power over 4 watts? i'm not
trying to start an arguement. i was just mentioning the fact that many
handhelds also have a hi-lo power switch.

```
     Probably both.  The neat thing is that you only need
     about a 6 amp source to power the radio under the most
     extreme of conditions.  Any constant source with a
     nearby spade connector is the one you want.  If you
     have trouble finding that, go to a high-end car stereo
     place and pay them to do it for you.  The main thing is
     to make sure that the radio is always connected to a source
     of power so that it will hold its memory.

A TX400 (the 400 probably means peak power) means that the average
power is 100.  You always assume 20 amps for every 100 average watts.
So, if you're driving that amp properly, any car's electrical
system should be able to handle the draw.  On SSB, double the draw.
Even then a regular car's electrical system should handle it.

We've hit a place where we can agree. Ham amps can be
used by CBers but they generally aren't just like CB
amps can be used by hams but they generally aren't.

Absolutely. That's the whole point. The AM and SSB audio depend
on the mic and the mic gain (dynamike) settings when TR24 is gone.
That gets you the highest possible performance from a Grant/148.
The same goes for TR/Q32 in the RCI/Galaxy radios.

Get the 79-290. If reception is that bad (which I doubt it will be unless you're a total newbie) you'll be very satisfied. Remember, you can always pull to the side of the road and shut the engine off. I doubt you'll ever have to do that, but that instantly negates any negative crap you've heard about the 79-290 receiver picking up high levels of engine noise. The 79-290 is a great value.

Don't see any solder bridge. I did notice the two power lead coils have had all the "black coating" burnt off of them. The diode across the coils was blown at one time and then replaced (looks like the red and black power cord had been crossed).

Also, the radio doesn't scan out-of-control when it's powered up on a bench power supply. It only locks up in scan mode when used on a vehicle cigarette plug. Currently there's only a 4 amp fuse in the cord. Would that make any difference if the radio is supossed the take a 7.5?

Hi 10 Ohm,

You guys are putting me up on a pedestal.

I only know a quarter of the Toll's, Dennis', and Bill's on this ng and I've only learned that through working with a close associate on our amp projects, building only a handful of amp's from published designs or kits and of course through much reading.

I consider myself thorough when it comes to research but I will never, ever be a component level design engineer.

I work for myself, but have as friends some switched on Bsc MIEE members who have written several published papers.

After much pushing by myself, a friend Peter has just completed the first prototype of a class-E FET amp which on a relatively low voltage (30v) has already generated 100w of RF with over 90% efficiency. This design is based on work by Raab at the California State University. 250w AM and 700w of CW for under 10 dollars! When the critical tuning has been sorted the class-S AM modulator will be next.

No, you will not find much info on the www, Bill did say he wanted 'leading edge':-)

This work has the potential to stamp on all bi-polar amp's, at far less cost and without all that heavy gauge wire wrapped around the Suburban.
>Technically Jack you can just simply tie the inputs and outputs of these
>amps together and retune your input and output shunt, now I personally would

>not suggested for the inexperienced, and I would be willing to bet you could
>learn a lot from Phil.
I don't dispute that this can work but it would not be my choice! I agree with what you say.

I think there are three camps in the amp world.

Those that are designing and building for the mass market where price and to a large degree big numbers are often quoted far above reality. If IMD figures were quoted well, I leave the rest up to you.

Those that build competition class-C amp's for this end of the market where above standard voltages are often used.

Finally, the competition amp builders that construct their very own comp amp's. Now it's OK if these people have someone fronting their products at shoot outs who have the rest of their system together, power supply, antenna etc. If they are representing themselves in the hope of making money from the sale of their wares after the shoot-out then they are surely going to pull out all the stop's in building the most bad ass amp possible and that includes going the extra mile in spending the time and dollars.
There is no point what so ever in running second place. That does not sell amp's as I witnessed at the Showdown in Motown with 123 and his X-Force units.

Just my 2c, I mean 2p.

Phil / UK

Rat Shack has fuse taps that insert into a blade type fuse socket right alongside an existing fuse, many import cars don't have acc'y. terminals. Find a fuse that is normally hot, generally less noise than from running an unshielded line through an engine compartment full of electronic modules. Have a friend who uses mini-8 coax to the battery and swears that the shielding helps a lot, never tried it myself....for 10 feet or so it might be worth a try, solder and shrink-tube or tape all of the connections, use a proper size ring connector to the battery terminal bolt.

Agreed. Rat Shack may not represent the best "value" for your dollar.
But as far as performance, they were no worse (or better) than top of
the line brands, like Cobra.

An interesting point. If the power maxed out at no more than 4 watts, then, I suppose, it could be legal. I would then wonder why we've never had such a feature before. A long time ago (1965) when my Lafayette Comstat 25 was made, there was a switch on the back that dropped power from 5 watts, to 100 mW. The idea there was that you could run your radio in the 100 mW position before your license came. The FCC didn't like that much and it disappeared soon after. But other than those radios, and handhelds, I've never seen "legal" CB's with out-of-the-box factory power adjustments before. I just assumed that the FCC didn't allow them for whatever reason.

Point of clarification. Not everyone who respects the rules, and
believes in legal operation are all "hams". That's where you make your
mistake by painting everyone with a broad-based brush. You are guilty of
2 generalizations with your statement:

1. All hams are "RF Police"

2. All Cbers are reckless lawbreakers.

> this portion of the ham community has the attitude that NO ONE who has a ham

> licence would EVER posess / use a piece of illegally modified equipment.
> case in point, rhooligan2 responded to this same post as a "big piece of dog
> poop".

There are hams that break rules, as there are CBers that break rules. The fact that some unnamed ham or CBer is running illegally, does not deprive another ham or CBer, who IS legal, from pointing out the error of running illegally to anyone asking for illegal mods. Many times newbies are not aware that what they ask is illegal. They may not want to be illegal.

> i rest my case.

> WHERE DID THEY GET THEIR AUTHORITY TO DICTATE TO ME / US WHAT TO DO WITH OUR
> LIVES / PROPERTY, (RADIOS).

Again you make the (mistaken) assumption that the only ones identifying illegal activity are hams. You are bordering on paranoia with statements that sound as if hams are all out to destroy CB. Most hams couldn't care less what Cbers do on their own band. The only time hams get on Cbers is when:
1. They illegally transmit on a ham band.
2. When they run such dirty equipment, that they interfere with the ham who's trying to work legal ham bands.

Other than that, they simply DON'T CARE.

> if i were to follow you everywhere you drive and stop everywhere you stop and
> everytime you turned around, i told you every little traffic infraction you

> you would be asking me the same question. WHO IN HELL ARE YOU AND MIND YOUR OWN
> BUSINESS.

Many people have been in CB radio for years. It is a hobby that has brought them many hours of enjoyment, and made them many new friends. Many of these old time CBers are becoming increasingly disturbed by the "new wave" CBer that has absolutely no respect for ANY rules, or even the simple actions of common courtesy. The "me first, up yours" attitude that has taken over society at large as well as the radio. The old timers are seeing their hobby being destroyed from the inside out, and in many cases are trying to fight back. If I care about my hobby, it IS my business, when someone else treats it with disrespect. Since we all are "the public", we all have a equal share of it, and it everyone's business. It's not like a private affair that you conduct behind closed doors. The radio is PUBLIC, so anytime you affect other people, it becomes their business as well.

>
>

Nope. If you have gone into the radio and totally f*cked it up my doing some mod that caused some other parts in the radio to go bad, Galaxy will not honor the two year warantee! That is straight out of the mouth of Monika, who I spoke with two weeks ago from Galaxy.
No one in their right mind would expect Galaxy to repair a radio for free that was damaged by someone who tried to modify it.
The mods John Mahoney at Panther Electronics perform will not harm the radio or void the two year warranty.

>And, Galaxy doesn't have any "certification" process.
>
>I think you where fed a line of shit.... Even if your radio does work good.

Panther Electronics is a "authorized" Galaxy repair center. They do repairs for Galaxy all the time.
If your Galaxy radio is still under warranty and you sent it to another cb shop, they would charge you for the repair and if they tried to fix it and damaged something, galaxy would not honor the warranty.
Being that Panther is a authorized Galaxy repair center, they would not charge you for the repair; Galaxy would pay Panther for the repair.
Do some homework, call Galaxy and find out for youself, go figure, and then run your mouth.

Interesting assumption. Two people I know have Chrysler Mini vans and run a
Larson Antenna mounted in between the hood and fender and run the coax
through a hole in the firewall and have very little engine noise on their
Uniden 66 & 76. So Roogie I don't know what to say to your reply. Can you
explain to me how you arrived at assumption?

Barry

Hello Mark:  What type antenna ya got there? Double check the assembly
instructions. Lat me know what type antenna you have? If you are
co-phasing the anrennas, it best to get them working one at a time.

Now with millions on the air, I can't see it being trashed as you say.
The skip of hundreds and hundred of stations out there cause a terrible
hetrodyne, a few amps won't hert. The problem is that the band is on a
"HF Band"

My advice to operators is accurate
> and well based. Unlike some folks here, if I don't have some good advice for a
> problem, I try to keep my mouth shut. Wish you and others could do the same.

Maybe you sell used cars to, ah?

I'm

I have a great repution. Guys on the radio say "Hay your Jay in the
Great Mojave Desert, love your postings on the CB news group, and keep
it up"
I reply "Thanks a million"

> Just, please, don't tell new guys it is just OK to buy and use an amp in their
> truck.....it isn't OK.
>

I don't think there going to listen to you, there gonna do what they
want.
You telling them "it isn't OK" is like waving a red lantern at a run
away train. Not real effective, but it may make you feel better. Do you
honestly belive anyones gonna believe you with all your unfriendly,
snotty, and biased posts you have posted here? I don't think so.

Jay at jay123a@qnet.com .... in the Great Mojave Desert, just down the
road ah ways from the fillin station.

Instead of turning OFF my boombox, I just turn the
volume DOWN*. I find it is a lot easier for me.

Question: Will the inner electronics leach away
          an appreciatable amount of electricity
          as I let the boombox sit for hours unused?
          It is powered by six D sized batteries.

* Only when I'm listening to the radio (not the
  CD ROM or tape).

  Big thanks, Gents.

>Money orders only NO C.O.D. s or personal checks + shiping and handling
send payment and choice of name and type. I will mail you your handle to you
same day air<

This has GOT to be the work of Fred Maia, W5YI. He's the same Ham who
sends out solicitations to file "renewals" for persons who's tickets are coming
up for expiration for $5.00.

Of course his solicitations FAIL to mention that the licensee could do it
themselves for 3 minutes of thier time and a first class stamp postage.

There's always a huckster.

Steve

Hello Landshark: Thanks for the complement.

Yeah Gary must think of me as a "Big Strap" on the Super Bowl. Well I am
not a Big Strap, and don't have the hardware to talk on the Super Bowl.
My Dads CB Amp I gave away to a blind guy, up on the Hill years ago.

But I do think of myself as a Big Strap metaly though, then laugh, at
myself thinking I must be getting worse with old age.

Listening to Rock & Roll music, in the Great Mojave Desert .... just
down the road ah ways from the fillin station.

A good friend to Big Bob famous CB'er and flossifier. Big Bob would
always say "Its always best to use two twenty or even two twenty one fer
them linears"

Which side would you ground the shield to? I would think that you would
want to ground the shield at the battery. then ground the radio to the
chassis inside the cab for the neg connection.

i have called a truce with 2 other hams on your side of the fence and a will attrmpt to do the same here with you because this is getting entirely out of hand.
if you read all of my posts on this subject in the last 5 or 6 months, you will see that the bottom line has NOT really been screw the rules / laws but has been if i / we choose to say screw the rules, you or no one else here have the right to come up on the perverbial high horse and swing a rule book and a brother-bubba-better-than-you attitude at us. my stated point all along has NOT been i'll flaunt the rules. it HAS been, if i choose to flaunt the rules, you, as a human being, have no authority over me to tell me no. you DO however have the right to gather evedence against me to give to the fcc. THEY and THEY ONLY have the authority to change my activities. if you have read ALL of the posts here in that time, there have been hams come on and, in the tradition of a true elmer, try to educate and inform about the legalities of out-band, power operation without benifit of a ram rod.
when this kind of message comes through on an eye to eye, person to person level, you'll see that i didn't go into attack mode.
when someone comes in from behind on their battle horse, screaming the battle cry, "if you ain't ham, you ain't shit", and swinging the rule sword, i make every effort to shoot them right out of the saddle. eye to eye dialog is alot easier to hear as the above mentioned screaming only causes sudden deafness.
i will put down my keyboard on this subject unles attacked again. it is NOT a surender because we still do not agree but i hope we can have a mutual respect for each others views, rights and opinions in the future.
have a good day.

jeff

What's wrong with this? The man is simply providing a service. To many, the convenience is worth the $5.

You could make the same argument about "Mailboxes, Etc." being "hucksters." For a fee, they will pack and ship your items for you. You could do it yourself for less, but that's your choice. Again, you pay for the convenience. You have the option.

Not sure that would be legal even if the power was kept at 100mW (yeah, right!) Wasn't there also something in Part 95 which required unlicensed, under 10mW operations to use antennas that were less than 5 feet in length and/or self-contained (?)

I have a Uniden PC-66a that will not xmit/rec on channels 6,10,16,20,26,30,36 and 40. All other channels are ok. I tested diodes D21,22,23,24,25 and 26 all ok. I also tested all pull-up resistors and they were ok as well. I changed the channel selector switch and this did nothing either. The LD (lock detector) pin on the pll chip (TC9106) goes low on all the above mentioned freqs. I Don't have a good schematic or truth table for the radio so I am asking your help in figuring this problem out. Thank you.

What you've just wrote has nothing to do with CB amps.  It's not a
stereotype--it's a fact.  CB amps are CB amps.  They can be used by
hams, but they were never aimed at hams.

You're letting this upset you... Relax.

I've been trying to figure out what is wrong with an RCI 2950 I looked at yesterday. Everything seems to be fine when it's powered up except the fact that it rapid-fire scans through all channels. It won't accept any commands from the buttons on the front of the radio (i.e MAN, DIM, SHF ect.), but all of the four rotating knob controls work fine.

Did something fry in one of the chips that controls the keypad interface? Does this sound like an easy fix? Expensive? Common problem?

Like I said everything else seems fine. Although, because of the unstoppable scanning, I haven't been able to hear any real conversations...only quick milli-second burts of audio as the radio just keeps right on scanning at high speed. No controls stop the scanning.

Thanks for you help,

Mark

The fuses are most likely under the dash on the left hand side or on the left kick panel. If you have a VOM you could find a fuse block that is hot all the time and hook it up there. That would be much better for this radio.
 See ya

Professor and James,

Set that radio (am) up to key 0 and
produce any amount of forward power...

Now tune a ssb rig to the same channel
and modulate the am transmitter, the signal
will be unintelligible on am but if you
switch to the upper or lower sidebands you
will hear a pair of mirror image signals
on both and perfectly intelligible as well!

Sounded like fun,

Jack

Face it, its going to happen were ever there are people communicating over a shared channel/frequency. I hear it all the time on 2 meters. Once people get a conversation started, they don't like to be interrupted, yet proper radio communication protocol says that other stations should be allowed to break in and you should accomadate them. People who ratchet jaw hate when this happens and as soon as someone makes an off comment about it, wham, an argument and possible feud ensues...

Well, the HF is the hairy freaks club. The UHF is the ultra hairy freaks club. Neither club can get along because they can't agree upon the proper amount of hairyness one should have on the scrotum sack to cause a females chin to be tickled the most...

I have a 959 that John Mahoney at Panther Electronics did the complete 959 makeover and it sounds great! It is the cleanest sounding radio I have ever heard. John knows his stuff and he only charged me $40 to do all of the 959 mods.
Plus, with John doing the mods, you don't void your two year warranty. He is a certified Galaxy radio repairman.
Send it to John and be done with it. I guarantee you will thank me later and you will be completely satisfied with the radio's performance.

>tries to be civilized about it.
>
>

once again, you are correct. if you could go back through all of the posts of the last 5 or 6 months, perhaps you would think about holding that mirror up infront of the rf police.

>>where?<
>
>   If you weren't spending so much time being obnoxious and spent a little
>more time READING some of the posts looking for more than troll-bait, you
>might
>have read it. Too late now.
>
i still don't catch your drift. please be more specific.

>>what are you talking about? aside from the freq difference, the rf
>technology
>and propagation are almost identical between 10 and 11 meters as evidenced by
>the interchangeablity of cb and ham radios to both services<
>
>   If it has to be spelled out for you, you are one of those people for
>whom
>the phrase "If you are not a part of the solution, you are a part of the
>problem" was authored.

we have another side stepper here. even when tring to "spell it out" you made a
left turn at buffalo and compleatly lost track of the subject at hand. go back
to buffalo and get your bearings.

>>it's too bad that cber's got there too late. hams have held the patent on
>this
>one since the 1950's.<
>
>   Since you bring it up, perhaps you'd be willing to provide us with a
>"for
>instance"...?
i believe that this was in reference to the double speak thing. it would be
helpful if you quoted all pertaining info.
in reference to the 1950's. i believe it was then that cb was born out of the
ham bands. hams can use all of the codes and seudo-noise toys, (computer
modems, packet, fax slow scan, roger beeps, ect.), where cb can use only am,ssb
voice.
then if we use an item that makes a noise other than words, you all cry foul.
you and your ilk would probably call cheat in a hand of solitare.

>>boy, talk about double speak!!!!!!!!!!!! all of the hams of the rf police
>persuation act as though God only speaks on ham freqs so don't run that shit
>on
>me boy.<
>
>   And how does my asserting that I am no better/no worse than any other
>man/woman equate to my being a mouthpiece for God?
>
actions speak louder than words. when you and the rf police act as though you
were God appointed guardians over the air waves to protect the world against
the evils of we out-banders, it speaks volumes about how high you hold
yourselves and how low you view us.

```
>
>(SNIP)...>so don't run that shit on me boy.<
>
>     So you are saying I *AM* better than you, Jeff?  Thanks for the
>complement, but I hardly think so...
>
you do cart-wheels really well.
i tell you to not run your shit on me and you say that i think that you are
better than me???
where did that come from?
as a human being, we are no better than one another which has been my point all
along. our views and opinions are what clash violently. how you draw a
compliment out of my telling you that you are full of shit is beond my
comprehention.

>     Again, thanks for the compliment, but perhaps if you weren't so
>insistant
>on cramming your opinions on what's acceptable/not-acceptable as far as
>responses top posts, others would just fade away?
>
again i have to complement you.
all you need to do is substitute "as far as responses top posts" for radio
operation/ /practices and you would have another great thought. i'll give you
an example:

perhaps if you weren't so insistant
on cramming your opinions on what's acceptable/not-acceptable as far as
radio operation/ /practices, others would just fade away?
does this sound familiar?
this is exactly what the rf police do.
this exactly where the impression comes from that these guys think they have
been appointed by God. now do you understand my point???

>     You make some valid points, but the "yelling" (internet style) and
>frequent blatant profanities only stereotypes you as one of "those" CBers, as
>opposed to the rest who try to make it a useful tool or enjoyable hobby.
>
>73
>
>Steve
>
on this point we have the perverbial pot calling the kettle black. not so much
you personally but the rest of the rf police have, at one time or another have
used PROFANITIES aimed at me and even if it isn't in capitals, if i whisper in
your ear that you are a "fool, asshole, idiot,jerk, dope, mommy's boy or fuck
face", it rings the challenge bell just as loudly as if they used a magaphone.
if they are going to show the extent of their potty training in this fashion,
then i assumed that this is all that they would understand. some also seem to
be a little hard of hearing.
well, enough side-stepping of the problem at hand.
we'll go on to the next question.
it's been fun.

Especially when the reasonable 10 meter radio will do 10 watts AM and
25 watts SSB which is about perfect in my book...

Fuck you, I was just screwing with you. Here's a suggestion. Move your pointer to the bottom left of the screen to the little "start" button. Click it, go to shut down, click on shut down computer. Then go outside and breathe. Poof! Instant non-virtual life! :)

I am finally moving my discone outside on my roof. The problem is that lightning has struck my chimney before. My question is: how do I ground this thing so it doesn't happen again? I'm using the thick coax, the "13" something.

Is it safe to run the coax down through the wall and then ground it in the crawl space using a gas discharge unit connected to an 8 foot copper rod pounded into the ground diagonally? Thanks

actually it is a 1/3 true. Lightning take three paths.

cloud to ground
ground to cloud and
cloud to cloud.

LIghtning is essentialy the breakdown of the atmosphere between two points. One will be positive and the other negative. Thus the ground can be negative and the cloud positive. Or vice versa. In either case the pootential difference in charge exceeds the dielectric strength of the atmosphere and the result is a discharge. Much the same as exceeding the voltage spec of a capacitor. It goes bang eventually.

On Thu, 07 Oct 1999 19:41:59 GMT, Professor <bgriffey@my-deja.com> wrote:

*Amplitude Modulation (AM)
*Amplitude Modulation occurs when a voice signal's varying voltage is
*applied to a carrier frequency. The carrier frequency's amplitude

*changes in accordance with the modulated voice signal, while the
*carrier's frequency does not change.
****

Not only does the carrier power remain constant during modulation, it simply does not change at all during modulation. What does change in amplitude is the frequencies around the carrier during modultation. Try and think of Amplitude Modulation as frequency translation. The audio frequyency of speech can not travel very far. So some means must be provided to move the audio frequencies generated by speech to another frequency that is more easier to transmitt or propogate over long distances. Thus we introduce the carrier. The carrier is the mixing agent that allows the voice audio to be translated up from the range of frequencies that our ears are able to distinguih, to one that is not distiguisable to hearing. The modulator acts like a mixer. Two frequency sources are injected in and three come out. The carrier and the sum and differences between the audio frequency and the carrier. It is this, the translated audio freqency, that is changing in amplitude because the speech that generated it, is changing in amplitude.

regards
james

****
*When combined the resultant AM signal consists of the carrier
*frequency, plus UPPER and LOWER sidebands. This is known as Double
*Sideband - Amplitude Modulation (DSB-AM), or more commonly referred to
*as plain AM.
*
*The carrier frequency may be suppressed or transmitted at a relatively
*low level. This requires that the carrier frequency be generated, or
*otherwise derived, at the receiving site for demultiplexing. This type
*of transmission is known as Double Sideband - Suppressed Carrier (DSB-
*SC).

Scot and the group:

Power distribution along an antenna that has no reactive loading components is fairly uniform. That is the power at one end is not much differet from the other end. Antennea with reactive loading elements will not have the power distributed over the antenna uniformaly. Since Power is defined as current times voltage and the voltage and current in an antenna are out of phase, from this we can easily see that power is somewhat uniformaly distributed over the length of the antenna. Again this will hold true for antenna with no reactive components inserted in. As for voltage feed or current feed, this will depend on the tuning of the antenna and where the feed point is with respect to lambda or wavelength.

example:

a halfwave antenna fed in the center will see an impedance of about 73 + j26. At the ends the resistive portion of the impednace can be as high as 1800 Ohms. The current at the feed point is much higher than at the ends. Like wise the voltage is very low at the feedpoint and very high at the ends. Since the antenna contains no reactive components, the cureent and voltage distribution is sinusoildal, (sine wave).

Now with antennae that have reactive components, (coils or caps) the current and voltage are no longer sinusoidal. Ther power radiated from the antenna is not uniform. In fact more power is radiated from the feed point along the length of the antenna to the reactive component.

Thus an antenna loaded with a coil in the center will have most of its power radiated from the feed point along the length to the base of the coil. The radiated power from the antenna deminishes linearly from the coil to the end of the antenna.

Now for base loaded antennnae, coil absorbs a portion of the radiated power and dissipates it as heat. The rest is radiated from above the coil and diminshes linearly from the coil to the end. Also the current and voltage in the antenna is no longer purely sinusoidal. The end will also be a voltge maximum. The base will be a current maximum.

For gain of an antenna with respect to a reference, one must know the pattern that the reference antenna produces. The pattern of enregy from the test antenna that exceeds the boundaries of the reference antenna, this is called gain. In

```
antenna gain must always be referenced to a source. Otherwise the gain figure is
meaningless. Antennae do not amplify the power delivered to them. They redirect
it. To obtain gain, energy from one direction must be taken and redistributed in
another direction. You cannot get something from nothing. The directivity of the
antenna is a more important factor than the gain.

regards
james

<<woah, back up jack.
you haven't been keeping up with the drama that has been unfolding here over the last 5 or 6 months.
here's a nutshell that i would challange anyone else to claim false:
1) people come here to rec.radio.cb to read, learn, inform, and ask questions.

2) generally, when someone asks a question, they are requesting an answer directly pertaining to said question. ie;
question: how do i put channels in my XYZ radio?
answer: cut here, jump there, change xtal ABC.
seems simple, doesn't it? not here.
if someone asks a question about channels or amplifiers, a portion of the ham community, the ones that i call the rf police or the sheriff and deputy, jump in with spam-like answers as to wether their actions are legal or not. i say spam-like because it has nothing to do with the specific question asked.
if someone were to inquire as to the legalities of such actions, these answers would be perfectly fine.
this portion of the ham community has the attitude that NO ONE who has a ham licence would EVER posess / use a piece of illegally modified equipment.
case in point, rhooligan2 responded to this same post as a "big piece of dog poop".
i rest my case.
they point and bitch at the dust pile in our yard while all the time ignoring the shit pile behind them.
all i'm saying to them is clean your yard first before you bitch about mine because we both have our shit pile but they have their noses up our asses so far that they can't smell.....>>>> <snip>

Jeff,

What you've proved with your 70-odd posts
is that you have an AWFUL lot of hate inside you
- and the energy to propagate it relentlessly.

You're taking this WAY too seriously.

Give it a rest.

No good news here. I've seem lightning actually explode a chimney, so given that, the best luck you will have for saving the radio during a storm is to disconnect the antenna. You can use lightning arrestors in-line, ground rods, lightning rods or whatever, but there is no guarantee of keeping the voltage out of the radio. I have a break in the coax with a barrel connector in a nice, rain free location, that I can easily access, and that antenna gets separated when the weather gets bad. Even with this, the voltage can just as easily get back in on the electrical system, so I try to disconnect the radio equipment from the power system as well. Surge supressors don't work for this either. Just cross your fingers and pull those plugs.

Federal law demands that you know the rules prior to transmitting, Andrew:

Title 47 - Telecommunication
Chapter I - Federal Communications Commission
Part 95 - Personal Radio Services
Subpart D - Rules for CB Service
Revised as of October 1, 1996

Rule 13 - Illegal Communications

{A} You must NOT use a CB station-
[9] to communicate with, or ATTEMPT to communicate with, any CB station more than 155.3 miles (250 kilometers) away

for the sake of technicality, it's 4 watts if you are refering to legal output
power.

just for the record, roger beeps, per se, are not music, are not intended to
attract attention but to signal the end of a transmission, do not whistle,
ammuse, entertain, arn't used in the begining of a transmission, and damn sure
don't last anywhere near 15 seconds.
nope, doesn't sound illegal to me.
in the 51 radios in my collection, only one has a roger beep and it's a HAM
radio.
you say hams use them on ssb to signal the end of a transmission?
on ssb cb when the skip isn't exactly optimum and we talk 124 miles GROUND
WAVE, it could come in handy at 12 watts pep. incidently, the one on my 2510
stays switched off.

from a legal standpoint i would have to disagree as you would have to prove intent.
in the real world i would have to agree with everything you say.

Well, I know the rules. Was just curious what he thought "short distances" were. There was a guy in Panama City who could key up and talk to me any day of the week. Approximately 200 miles!

Hello all. Looking into buying a couple Cherokee SA-4 antennas for my
handhelds. Bills 2 Way has them for $19.90 plus S&H. Was wondering if anyone
knows of a better price. Appreciate any input you may have. Thanks in
advance.
Russ
